

Terms of Reference for the Solutions Working Group (NFV SOL WG)

Responsibilities

The main responsibilities of this working group are:

- Delivering a consistent consolidated set of protocols and data models specifications to support interoperability over identified NFV reference points.
- Maintenance of specifications related to protocols and data models within the scope of this WG.

Areas of activity / scope

The areas of activity include the documentation of data models, APIs (and the underlying protocols) for a set of identified functions, templates/descriptors and interfaces of the NFV architecture framework.

The actual form of the specifications delivered (newly-developed specification, endorsement of external specifications or profiling of external published work, to adapt it to ISG NFV needs and requirements) will depend on the work item.
