46 Intellectual Property Rights

47 IPRs essential or potentially essential to the present document may have been declared to ETSI. The information
 48 pertaining to these essential IPRs, if any, is publicly available for **ETSI members and non-members**, and can be found
 49 in ETSI SR 000 314: "*Intellectual Property Rights (IPRs); Essential, or potentially Essential, IPRs notified to ETSI in*
 50 *respect of ETSI standards*", which is available from the ETSI Secretariat. Latest updates are available on the ETSI Web
 51 server (<http://ipr.etsi.org>).

52 Pursuant to the ETSI IPR Policy, no investigation, including IPR searches, has been carried out by ETSI. No guarantee
 53 can be given as to the existence of other IPRs not referenced in ETSI SR 000 314 (or the updates on the ETSI Web
 54 server) which are, or may be, or may become, essential to the present document.

55 Foreword

56 This European Standard (EN) has been produced by ETSI Technical Committee Access, Terminals and Transmission,
 57 Multiplexing (ATTM).

58 The present document is part 2, sub-part 3 of a multi-part deliverable covering lifecycle resource management of
 59 broadband deployment as identified below:

60 **EN 305 200 series: Energy management: Operational infrastructures: Global KPIs**

61 EN 305 200-1: General requirements

62 **EN 305 200-2 series: Specific requirements**

63 Sub part 1: ICT sites

64 Sub part 2: Fixed broadband access networks

65 **Sub part 3: Mobile broadband access networks**

66 Sub part 4: Cable access networks

67 EN 305 200-3: Specific requirements : ICT sites

68 Sub part 1: DCEM

71

72

73 Modal verbs terminology

74 In the present document "shall", "shall not", "should", "should not", "may", "need not", "will", "will not", "can" and
 75 "cannot" are to be interpreted as described in clause 3.2 of the [ETSI Drafting Rules](#) (Verbal forms for the expression of
 76 provisions).

77
 78 "must" and "must not" are NOT allowed in ETSI deliverables except when used in direct citation.

79 Introduction

80 Energy costs continue to rise, a trend that will continue in the future, while broadband penetration is introducing new
 81 active equipment to the network architecture. In this context, and to reflect other environmental aspects of
 82 sustainability, it is vital that the main telecommunication operators implement effective general engineering of fixed
 83 and mobile broadband networks and sites provisioning, managing or using those networks (i.e. ICT sites) in order to
 84 respond to critical issues of energy consumption while proposing essential solutions to true broadband deployment. To
 85 guide this process, it is essential that metrics are defined, termed Global Key Performance Indicators (KPIs), that enable
 86 energy usage to be managed more effectively.

87 The Global Key Performance Indicators of the EN 305 200 series address operational infrastructures and do not
 88 consider design/operation of components of broadband deployment networks.

89 The EN 305 200 series of standards comprises:

- 90 • EN 305 200-1: a generic requirements document addressing Global KPIs for operational infrastructures;
- 91 • a sub-series EN 305 200-2 that defines the Global KPIs, and drives energy management targets, for specific
 92 operational networks and sites and which describes how the Global KPIs are to be applied (which may be used to
 93 support future regulatory objectives);
 - 94 - EN 305 200-2-1: ICT sites;
 - 95 - EN 305 200-2-2: Fixed broadband access networks;
 96 NOTE: excluding cable access networks (see EN 305 200-2-4)
 - 97 - EN 305 200-2-3: Mobile broadband access networks;
 - 98 - EN 305 200-2-4: Cable operator access networks.

99 The documents do not define weightings of Objective KPIs or targets or limits for Global KPIs. Where
 100 relevant such information is provided in a related ETSI ES in the ES 205 200-2 series.

- 101 • a sub-series EN 305 200-3 that defines particular implementations of Global KPIs within ICT sites based on the
 102 requirements of EN 305 200-2-1, and which may define levels of performance to simplify and provide clearer
 103 understanding of Global KPIs allowing the evaluation of performance of energy use management in ICT sites.

104 The documents do not define weightings of Objective KPIs or targets or limits for Global KPIs. Where relevant
 105 such information is provided in a related ETSI ES in the ES 205 200-3 series.

106 These documents will accelerate:

- 107 • availability of operational infrastructure architectures and network implementations that use energy more
 108 efficiently;
- 109 • the definition and attainment objectives for other environmental aspects of sustainability for operational broadband
 110 networks.

111 The present document specifies the requirements for a Global KPI for energy management (KPI_{EM}) and their
 112 underpinning Objective KPIs for the mobile access networks of broadband deployment. The requirements are mapped
 113 to the general requirements of EN 305 200-1.

114 1 Scope

115 The present document specifies the requirements for a Global KPI for energy management (KPI_{EM}) and their
116 underpinning Objective KPIs addressing the following objectives for the mobile access networks of broadband
117 deployment;

- 118 • energy consumption;
- 119 • task efficiency;
- 120 • energy reuse;
- 121 • renewable energy.

122 The requirements are mapped to the general requirements of EN 305 200-1.

123 Energy management of mobile access networks comprises a number of independent layers. This document addresses
124 performance of infrastructures that supports the normal function of hosted ICT equipment within the mobile access
125 network (e.g. power distribution, environmental control, security and safety). The present document does not address
126 other layers such as performance of ICT equipment itself, performance of usage of available processing power, and
127 layers related to final service delivered (e.g. processing power required per itemised outcome) or overlay layers (e.g.
128 final energy required per itemised outcome).

129 The comparative costs and environmental impact of different energy sources are outside the scope of the present
130 document.

131 Within the present document:

- 132 • clause 4 describes the energy parameters for mobile access networks together with inclusions/exclusions of
133 different energy sources;
- 134 • clause 5 specifies the requirements for measurement, calculation, classification and reporting of KPI_{EM} .

135 2 References

136 References are either specific (identified by date of publication and/or edition number or version number) or
137 non-specific. For specific references, only the cited version applies. For non-specific references, the latest version of the
138 referenced document (including any amendments) applies.

139 Referenced documents which are not found to be publicly available in the expected location might be found at
140 <http://docbox.etsi.org/Reference>.

141 NOTE: While any hyperlinks included in this clause were valid at the time of publication, ETSI cannot guarantee
142 their long term validity.

143 2.1 Normative references

162 3 Definitions, symbols and abbreviations

163 *Definitions and abbreviations extracted from ETSI deliverables can be useful when drafting documents and can be*
 164 *consulted via the **Terms and Definitions Interactive Database (TEDDI)** (<http://webapp.etsi.org/Teddi/>).*

165 3.1 Definitions

166 For the purposes of the present document, the terms and definitions given in EN 305 200-1 and the following apply:

167 **backhaul infrastructure:** functional elements connecting a base station to an operator site

168 **base station (BS):** network distribution node (NDN) which serves one **or more** cells of a mobile access network

169 **network distribution node (NDN):** grouping of NTE equipment within the boundaries of an access network providing
 170 distribution of service from an operator site (OS)

171 NOTE: where all the network telecommunications equipment (NTE) at a given location is under common governance, any supporting infrastructure
 172 for power distribution and environmental control together with the necessary levels of resilience and security required to provide the desired service
 173 availability is included as part of the NDN

174 **network telecommunications equipment (NTE):** equipment between the boundaries of, and dedicated to providing
 175 direct connection to, core and/or access networks

176 **operator site (OS):** premises accommodating network telecommunications equipment (NTE) providing direct
 177 connection to the core and access networks and which may also accommodate information technology equipment (ITE)

178 NOTE 1 to entry: an operator site that is only connected to the core network is considered as a network data centre

179 NOTE 2 to entry: an operator site of a cable access network may be termed a local head-end

180 **repeater:** device with two RF ports, both of which are intended to be connected to antennas, which is capable of
 181 receiving, amplifying and transmitting simultaneously in one direction a signal in a BSS transmit band and in the other
 182 direction a signal in the corresponding BSS receive band
 183 [SOURCE: ETSI EN 301 489-50]

184 **user equipment (UE):** definition required

185 EDITORS NOTE: during the development of the document see **xxxxxx**

186 3.2 Symbols

187 For the purposes of the present document, the symbols given in EN 305 200-1 and the following apply:

188 E_{REUSE} reused energy
 189 E_{REN} renewable energy
 190

191 3.3 Abbreviations

192 For the purposes of the present document, the abbreviations given in EN 305 200-1 and the following apply:

193	3GPP	
194	AC	Alternating Current
195	BS	Base Station
196	DL	DownLink
197	E-UTRA	Evolved UMTS Terrestrial Radio Access Network
198	KPI	Key Performance Indicator
199	LTE	Long Term Evolution
200	NA	Not Applicable
201	NDN	Network Distribution Node
202	NTE	Network Telecommunications Equipment
203	OS	Operator Site
204	RX	Receiver
205	TRX	Transceiver
206	UE	User Equipment
207	UL	UpLink
208	UL/DL	Uplink/Downlink
209	UMTS	Universal Mobile Telecommunication Service
210	UTRAN	UMTS Terrestrial Radio Access Network
211	WCDMA	Wideband Code Division Multiple Access

214 4 Energy management of mobile access networks

215 4.1 General

216 4.1.1 Mobile broadband access networks

217 The ESO submission of June 2011 to the European Commission in response to Mandate M/462 (dealing with “efficient
 218 energy use in fixed and mobile information and communication networks”) used Figure 1 as an overall schematic to
 219 describe with fixed and mobile networks of broadband deployment. Since that time the schematic has been subject to
 220 change and is replaced by Figure 2.

* out of scope of Mandate M/462

221

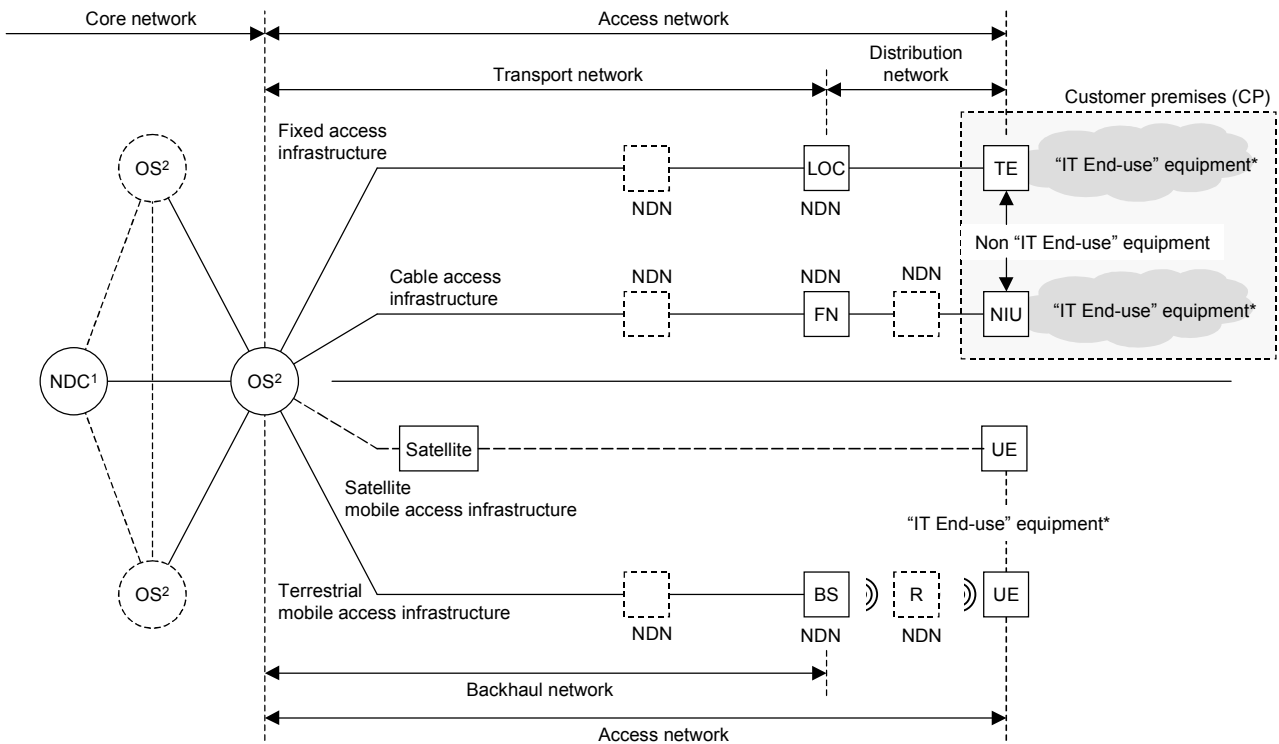

222 **Figure 1 - Schematic of fixed and mobile communication networks (June 2011)**

223 The principal changes for mobile access networks are that network distribution nodes (NDNs) are shown and the base
 224 station (BS) and repeater (R) are shown as specific examples of NDNs. Also user equipment (UE) has replaced
 225 terminal equipment (TE).

226 Within the mobile access network in Figure 2, the term NDN is employed to describe a variety of aggregations of NTE
 227 at locations between the operator site (OS) and the UE. The diagram shows certain NDNs within dashed boxes to
 228 indicate that they are:

- 229 • optional;
- 230 • not restricted in number to the configurations shown.

231

¹ For cable access networks this is termed "Master head-end/OS"

² For cable access networks this is termed "Local head-end/OS"

* out of scope of Mandate M/462

232

233

Figure 2 - Updated schematic of fixed and mobile communication networks

234 4.1.2 Mobile access network technologies

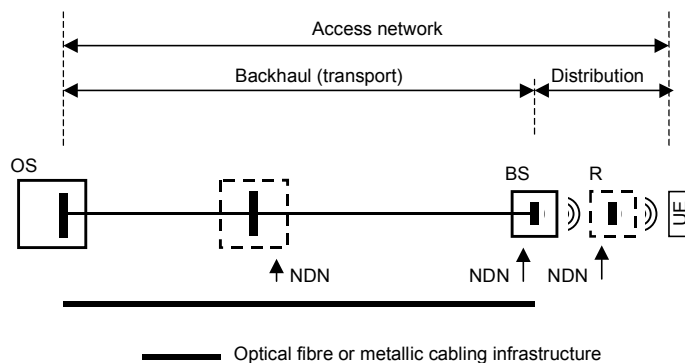

235 The present document addresses energy management in mobile access networks using, but not restricted to, the
 236 following technologies:

- 237 • UTRA, WCDMA (IMT-2000 Direct Spread, W-CDMA, UMTS);
- 238 • E-UTRA, LTE (IMT-2000 and IMT advanced);
- 239 • GSM (IMT-2000 SC, Technology GSM/EDGE).

240 As shown in the schematic of Figure 3, the backhaul infrastructures may be comprise metallic or optical fibre cabling.

241 In the most general sense, the OS and NDNs contain NTE of multiple access technologies. The totality of a cable access
 242 network under the governance of a given operator takes into account all NTE (in terms of both energy consumption and
 243 data volumes).

244

245

246

Figure 3 - Mobile access network implementations

247 4.1.3 Energy consumption

248 The energy consumption of BS, R (where used) and the BS sites is described in EN 303 472.

249 It should be noted that optical fibre and metallic cabling infrastructures shown in Figure 3 refer to the
250 telecommunications transmission media. Telecommunications transmission energy loss (indirect consumption) in the
251 backhaul infrastructure assumed to be negligible.

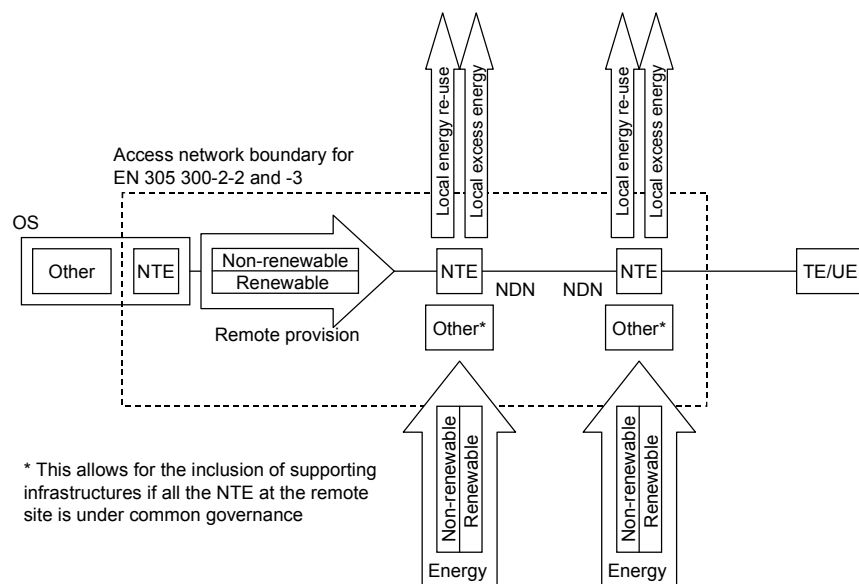

252 Some of the mobile access network implementations may require the use of active equipment at the NDNs within the
253 backhaul infrastructure shown in Figure 3.

254 In some cases, the site accommodating the backhaul infrastructure NDNs may also require power to provide
255 environmental control for the NTE together with other infrastructures to provide the necessary levels of resilience and
256 security required to provide the desired service availability. Where all the network telecommunications equipment
257 (NTE) at a given backhaul infrastructure NDN location is under common governance, the supporting infrastructures are
258 included as part of the NDN. In other case, the energy consumption of the backhaul infrastructure NDN is restricted to
259 that of the NTE.

260 Separate elements within the telecommunications cabling may be used to distribute power to a backhaul infrastructure
261 NDN from the OS or from other NDNs. In such cases, the energy loss (indirect consumption) in the cabling of the
262 mobile access network may be non-negligible and shall be taken into account within the energy consumption of the
263 mobile access network by including the relevant consumption at the source.

264 As shown in Figure 4, energy management within the mobile access network addresses energy consumption at an
265 overall level to the OS and NDNs from both non-renewable and renewable sources. This supports the use of renewable
266 energy which is locally generated or is supplied to the OS and NDN(s) via a contribution within the utility (grid) from
267 other sites under common governance with the mobile access network.

268 Renewable energy content generated at the OS and NDNs or supplied to those locations the grid (utility) is subject to
269 the same considerations as for ICT sites (see EN 305 200-2-1 and 5.1.2.4).

270

271 **Figure 4 - Schematic of FAN profile-based energy management**

272 As shown in Figure 4, NDNs may be associated with locally generated energy generation which exceeds the demands
273 of the NDNs at that location. This energy may be provided to other facilities and infrastructures which are independent
274 from the access network. The KPI_{EM} of the present document takes no account of any such excess provision.

275 The re-use of energy at an operator site (OS) is addressed in the Objective KPIs of ICT sites (see EN 305 200-2-1 [i.2]
276 and EN 305 200 series [i.3]).

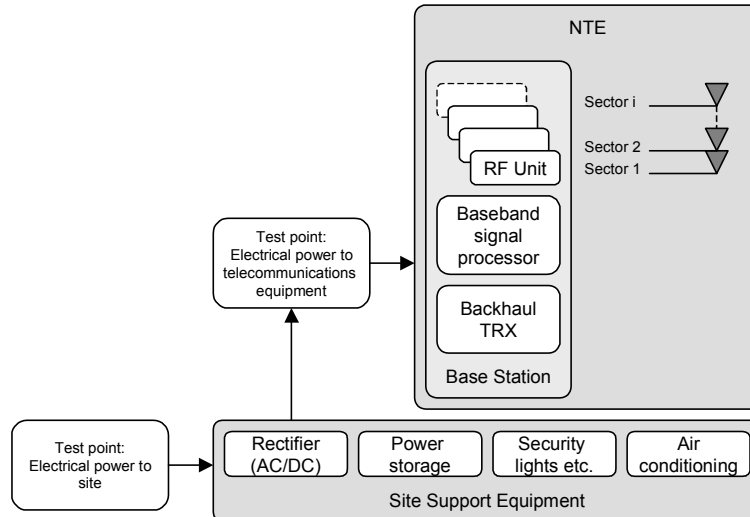

277 With regard to energy re-use, the NDNs of the present document are not considered to be of material effect.

278 **Equipment providing NFV functionality is accommodated outside the boundaries of the access network then
279 its energy consumption**

280 shall be included in the overall energy consumption of the specific access network technology

281 4.1.4 Data volume

282 The data volume of a given mobile access network technology is to summation of uplink (UL) and downlink (DL) data
283 (bit/s) at the backhaul transceiver (TRX) devices of the BS as indicated in Figure 5.

284
285 **Figure 5 - Schematic of BS and BS site infrastructure**

286 4.2 Related standards

287 5 Global KPI (KPI_{EM}) for mobile access networks

288 5.1 General

289 5.1.1 Global KPI (KPI_{EM}) for mobile access networks

290 In accordance with EN 305 200-1, KPI_{EM} for mobile access networks has the form:

$$291 KPI_{EM} = f(KPI_{EC}, data_volume)$$

292 where:

293 KPI_{EC} = Objective KPI for energy consumption (see 5.1.2.1);
294 $data_volume$ summation of UL and DL data processed at the backhaul transceiver (TRX) devices of the BS
295 during the assessment period for KPI_{EC}

296 5.1.2 Objective KPIs

297 5.1.2.1 Energy consumption (KPI_{EC})

298 A reduction in the energy consumption required to provide a given level of service is a primary objective of the present
299 document.

300 The value of KPI_{EC} is relevant to each mobile access network technology solution.

301 Unless otherwise specified, the applicable energy consumption is that of the NTE and takes no account of any
302 additional loads required to maintain the effective operation of the NTE.

303 For a given mobile access network technology model, the KPI_{EC} may be improved by local actions within the OS and
 304 NDNs by the use of NTE with reduced energy consumption.

305 Requirements or recommendations in relation to the improvement of the energy consumption of the NTE and support
 306 infrastructures are not within the scope of the present document.

307 Objectives for energy consumption of NTE within OS are included in the European Commission DG JRC Code of
 308 Conduct on Energy Consumption of Broadband Equipment [i.2]. Similar equipment will also be found in NDNs.

309 5.1.2.2 Task efficiency (KPI_{TE})

310 Not applicable in the present document.

311 5.1.2.3 Energy re-use (KPI_{REUSE})

312 Not applicable in the present document.

313 5.1.2.4 Renewable energy (KPI_{REN})

314 The use of renewable energy is a secondary objective of the present document. The KPI_{REN} is embedded within KPI_{EC} .

315 An OS or NDN may meet all its energy needs from local, renewable (like solar or wind energy) sources on a continuous
 316 basis.

317 KPI_{EC} takes account of renewable energy that is produced by:

- 318 a) sources dedicated to and directly serving an OS or NDN;
- 319 b) sources from which it is conveyed by the utility (grid) serving an OS or NDN defined for the application of the

320 KPI_{EM} ;

321 NOTE 1: these sources may be an OS, NDN or a generator and shall be under common governance with the FAN it serves.

322 NOTE 2: This does not, as yet, take into consideration any proportion of renewable electricity in the mix of production of utility supplies
 323 certified as "green" (e.g. based on the carbon footprint of the energy source) by electricity suppliers or in accordance with
 324 nationally recognised schemes.

325 In the case of (b), the renewable energy (E_{REN}) in KPI_{EC} is counted as renewable energy at the recipient site provided
 326 that the energy produced is not considered in the public mix and there is no feed-in contract. The portion of such energy
 327 allocated to the (which) ICT site or NDN added to other ICT site or NDN consumptions shall not exceed the overall
 328 energy consumption by the ICT site or NDN.

329 The loss produced by the utility (grid) shall be included at the recipient ICT site(s) or NDNs. If losses are not otherwise
 330 specified, a default loss of 10 % shall be used.

331 NOTE: a power source producing 100 kW is assumed to deliver 90 kW to recipient ICT sites

332 5.2 Scale

333 KPI_{EM} is expressed with units of bits/W.

334 The dominant factor in the calculation of KPI_{EM} is the data volume served by the Objective KPI for energy consumption
 335 (KPI_{EC}).

336 The value of KPI_{EC} is mitigated by any energy contribution from renewable sources (KPI_{REN}).

337 5.3 Evolution

338 The use of a profile-based approach shall take into account various stages of network growth and utilisation.

339 5.4 Definition of boundaries

340 5.5 Formulae

341 5.5.1 Global KPI (KPI_{EM}) for mobile access networks

342 An assessment of KPI_{EM} requires that the energy supplied to the mobile access network provides all the primary
 343 functions of the network (i.e. NTE load, environmental control etc). If the supply of energy of any of the non-NTE
 344 loads is provided by other supplies not included in KPI_{EC} then KPI_{EM} cannot be assessed.

345 KPI_{EM} is defined mathematically as:

$$346 \quad KPI_{EM} = W \times \sum_{t=1}^{t=T} \frac{data_volume_t}{KPI_{EC_t}}, \text{ subject to a minimum value of 0.}$$

347 This is shown schematically in Figure 6.

348 **Figure 6 - Schematic of KPI_{EM} calculation and drivers**
 349

350 5.5.1.1 Definition of terms

351 $data_volume_t =$ summation of UL and DL data at the backhaul TRX of the NTE at the BS during the KPI
 352 assessment period k (in the interval t_k^{begin} to t_k^{end}) as described in detail in clause 5.6 of EN 305
 353 200-1

354 $KPI_{EC,t} =$ Objective KPI for energy consumption for mobile access network technology t

355 $t =$ mobile access network technology index

356 $W =$ weighting of the profile applied (see clause 5.6)

357 5.5.1.2 Clarity

358 5.5.1.3 Criteria

359 5.5.2 Objective KPIs for mobile access networks

360 5.5.2.1 Energy consumption (KPI_{EC})

361 5.5.2.1.1 Formula

$$362 \quad KPI_{EC_t} = \sum_{i=1}^N C_n - E_{REN_n}$$

363 5.5.2.1.2 Definitions of terms

364 $n =$ index of OS or NDN sites (OS = 1, BS or R, if present, = N)

365 $N =$ total number of OS and NDN sites

366 $C_n =$ energy consumption of the NTE at site n

367 $E_{REN,n} =$ renewable energy content for the NTE at site n

368 5.5.2.1.3 Clarity

369 5.5.2.1.4 Criteria

370 5.5.3 Data_volume (*data_volume*)

371 5.5.3.1 General

372 5.5.3.2 Formula

373 5.5.3.3 Definitions of terms

374 5.5.3.4 Clarity

375 5.5.3.5 Criteria

376 5.6 Application of profiles

377 5.6.1 Universal consumption measurement

378 The most advantageous methodology for the determination of $KPI_{EC,t}$ is to measure the performance of every OS and
379 NDN for a default assessment period of a year. This is because:

- 380 • each part of the mobile access network may be subject to different environmental conditions which will affect the
381 energy consumption required to maintain the desired conditions for effective and long-term operation of the NTE
382 accommodated at those locations;
- 383 • those environmental conditions may vary over time in a random manner due to their location and the construction
384 of the structure housing the NDN.

385 Shorter assessment periods may be applied where seasonal climate variations are sufficiently small to enable the
386 assessment period to exhibit the equivalence to the default assessment period. In such cases, the period shall be based
387 upon the minimum period required to reflect annualised data volumes based on historical traffic patterns for the mobile
388 access network.

389 The mobile access network configuration shall not change during the assessment period. In case of change a new
390 assessment period shall be initiated. The assessment period shall exclude any time during which engineering trials of
391 energy efficiency measures are employed on a temporary basis.

392 The value of W for this approach is 1.

393 5.6.2 Statistic-based extension of consumption measurement

394 Where it is not viable to define the “real time” energy consumption and renewable energy utilisation at individual OS
395 and NDNs across an entire mobile access network then it is possible to effect a “design” value for the network in
396 relation to KPI_{EC} it is not appropriate to consider such values as truly operational.

397 Text required to explain the approach.

398 See Annex A.

399 The value of W for this approach is that found in ES 205 200-2-3.

400 5.6.3 Profile-based extension of consumption assessment

401 Where it is not viable to define the “real time” energy consumption and renewable energy utilisation at individual OS
402 and NDNs across an entire mobile access network then it is possible to effect a “design” value for the network in
403 relation to KPI_{EC} it is not appropriate to consider such values as truly operational.

404 The use of design models for each mobile access network technology coupled with load profiles is one way around this
405 problem and can provide values of KPI_{EC} which can be used to meet the requirements of EN 305 200-1, clause 6, which
406 states:

407 *The objective of the EN 305 200 documents is to define Global KPIs for energy management that can be applied to all*
408 *operational infrastructures of a given type*

409 *For example, operational infrastructures required to deliver high reliability (based on resilience of support infrastructures such*
410 *as power distribution and environmental control) will tend to exhibit higher values of a Global KPI for energy management.*

411 *Similarly, operational infrastructures of a given type but serving a different function (business models or primary technology*
412 *employed) cannot be directly compared - although it is recognised that technology evolution may exhibit lower values of a*
413 *Global KPI for energy management.*

414 *Objective and Global KPIs are generally used in order to indicate trends within a particular implementation of a given type of*
415 *operational infrastructure and to indicate improvements achieved across the four objectives identified in clause 4.*

416 Text required to explain the approach.

417 See Annex B.

418 The value of W for this approach is that found in ES 205 200-2-3.

419 5.7 Reporting

420

 421 Annex A: Statistical approach

422 A.1 «xx»

423 A.1.1 «yyy»

424

 425 Annex B: Profile-based approach - Example

		Overall percentage	Overall percentage	Overall percentage
		30	30	40
		Load		
Overall percentage	Operational condition	Low	Medium	High
35	A	10,5 %	10,5 %	14,0 %
35	B	10,5 %	10,5 %	14,0 %
30	C	9,0 %	9,0 %	12,0 %

426

427

OPERATION CONDITION A

		Parameter A	Parameter B	Parameter C
		20	50	30
		Load		
Overall percentage	Parameter	Low	Medium	High
25	X	5,0 %	12,5 %	7,5 %
50	Y	10,0 %	25,0 %	15,0 %
25	Z	5,0 %	12,5 %	7,5 %
