Intellectual Property Rights

Essential patents

IPRs essential or potentially essential to normative deliverables may have been declared to ETSI. The declarations pertaining to these essential IPRs, if any, are publicly available for **ETSI members and non-members**, and can be found in ETSI SR 000 314: "Intellectual Property Rights (IPRs); Essential, or potentially Essential, IPRs notified to ETSI in respect of ETSI standards", which is available from the ETSI Secretariat. Latest updates are available on the ETSI Web server (https://ipr.etsi.org/).

Pursuant to the ETSI Directives including the ETSI IPR Policy, no investigation regarding the essentiality of IPRs, including IPR searches, has been carried out by ETSI. No guarantee can be given as to the existence of other IPRs not referenced in ETSI SR 000 314 (or the updates on the ETSI Web server) which are, or may be, or may become, essential to the present document.

Trademarks

The present document may include trademarks and/or tradenames which are asserted and/or registered by their owners. ETSI claims no ownership of these except for any which are indicated as being the property of ETSI, and conveys no right to use or reproduce any trademark and/or tradename. Mention of those trademarks in the present document does not constitute an endorsement by ETSI of products, services or organizations associated with those trademarks.

DECTTM, **PLUGTESTSTM**, **UMTSTM** and the ETSI logo are trademarks of ETSI registered for the benefit of its Members. **3GPPTM** and **LTETM** are trademarks of ETSI registered for the benefit of its Members and of the 3GPP Organizational Partners. **oneM2MTM** logo is a trademark of ETSI registered for the benefit of its Members and of the oneM2M Partners. **GSM**® and the GSM logo are trademarks registered and owned by the GSM Association.

Foreword

This Harmonised European Standard (EN) has been produced by ETSI Technical Committee Electromagnetic compatibility and Radio spectrum Matters (ERM).

The present document has been prepared under the Commission's standardisation request C(2015) 5376 final [i.3] to provide one voluntary means of conforming to the essential requirements of Directive 2014/53/EU on the harmonisation of the laws of the Member States relating to the making available on the market of radio equipment and repealing Directive 1999/5/EC [i.1].

Once the present document is cited in the Official Journal of the European Union under that Directive, compliance with the normative clauses of the present document given in Table A.1 confers, within the limits of the scope of the present document, a presumption of conformity with the corresponding essential requirements of that Directive, and associated EFTA regulations.

The present document is part 5, sub-part 1, of a multi-part deliverable covering Advanced Surface Movement Guidance and Control System (A-SMGCS), as identified below.

- Part 1: "Community Specification for application under the Single European Sky Interoperability Regulation EC 552/2004 for A-SMGCS surveillance service including external interfaces";
- Part 2: "Community Specification for application under the Single European Sky Interoperability Regulation EC 552/2004 for A-SMGCS airport safety support service";
- Part 3: "Community Specification for application under the Single European Sky Interoperability Regulation EC 552/2004 for a deployed cooperative sensor including its interfaces";
- Part 4: "Community Specification—for application under the Single European Sky Interoperability Regulation EC 552/2004 for a deployed non-cooperative sensor including its interfaces";

Part 5: "Harmonised Standard for access to radio spectrum for <u>multilateration Multilateration (MLAT)</u> equipment":

Sub-part 1:— "Receivers and Interrogators";

Sub-part 2: "Reference and vehicle transmitters";

- Part 6: "Harmonised Standard for access to radio spectrum for deployed surface movement radar sensors";
- Part 7: "Community Specification for application under the Single European Sky Interoperability Regulation EC 552/2004 for A-SMGCS routing service";
- Part 8: "Community Specification for application under the Single European Sky Interoperability Regulation EC 552/2004 for A-SMGCS guidance service".

National transposition dates	
Date of adoption of this EN:	9 March 20203 October 2023
Date of latest announcement of this EN (doa):	30 June 202031 January 2024
Date of latest publication of new National Standard or endorsement of this EN (dop/e):	31 December 2020 July 2024
Date of withdrawal of any conflicting National Standard (dow):	31 December 2021 <u>July 2025</u>

Modal verbs terminology

In the present document "shall", "shall not", "should", "should not", "may", "need not", "will", "will not", "can" and "cannot" are to be interpreted as described in clause 3.2 of the ETSI Drafting Rules (Verbal forms for the expression of provisions).

"must" and "must not" are NOT allowed in ETSI deliverables except when used in direct citation.

Introduction

A-SMGCS are systems providing routing, guidance, surveillance and control to aircraft and affected vehicles in order to maintain movement rate under all local weather conditions within the Aerodrome Visibility Operational Level (AVOL) whilst maintaining the required level of safety.

1 Scope

The present document specifies technical characteristics and methods of measurements for the following equipment:

- 1) Interrogators transmitting in the 1 030 MHz band, used in Mode S multilateration equipment in an Advanced Surface Movement Guidance and Control System (A-SMGCS).
- 2) Receivers, receiving in the 1 090 MHz band, used in Mode S multilateration equipment in an Advanced Surface Movement Guidance and Control System (A-SMGCS).

Antennas for this equipment are external and-passive without an additional amplifier.

The present document does not apply to equipment which includes a transponder function, to ground vehicle locators and to reference transmitters which do not contain receivers for the purpose of replying to interrogation.

NOTE: The relationship between the present document and essential requirements of article 3.2 of Directive 2014/53/EU [i.1] is given in Annex A.

2 References

2.1 Normative references

References are either specific (identified by date of publication and/or edition number or version number) or non-specific. For specific references, only the cited version applies. For non-specific references, the latest version of the referenced document (including any amendments) applies.

Referenced documents which are not found to be publicly available in the expected location might be found at https://docbox.etsi.org/Reference/.

NOTE: While any hyperlinks included in this clause were valid at the time of publication, ETSI cannot guarantee their long term validity.

The following referenced documents are necessary for the application of the present document.

[1]	ICAO Annex 10, Volume IV: ICAO Annex 10, Volume IV: "Surveillance Radar and Collision Avoidance Systems", 5 th edition, July 2014, including amendments up to amendment 8991 dated 18-07-2022.
[2]	EUROCAE ED 117A (September 2016): "MOPS for Mode S Multilateration Systems for Use in Advanced Surface Movement Guidance and Control Systems (A-SMGCS)".
1	Void.
[3]	ERC/Recommendation 74-01 (2019): "Unwanted emissions in the spurious domain".
2.1]	ETSI EN 300 019-1-3 (V2.4.1) (04-2014): "Environmental Engineering (EE); Environmental conditions and environmental tests for telecommunications equipment; Part 1-3: Classification of environmental conditions; Stationary use at weatherprotected locations".
[4]	ETSI EN 300 019-1-4 (V2.2.1) (04-2014): "Environmental Engineering (EE); Environmental conditions and environmental tests for telecommunications equipment; Part 1-4: Classification of environmental conditions; Stationary use at non-weatherprotected locations".

2.2 Informative references

References are either specific (identified by date of publication and/or edition number or version number) or non-specific. For specific references, only the cited version applies. For non-specific references, the latest version of the referenced document (including any amendments) applies.

NOTE: While any hyperlinks included in this clause were valid at the time of publication, ETSI cannot guarantee their long term validity.

The following referenced documents are not necessary for the application of the present document but they assist the user with regard to a particular subject area.

[i.1]	Directive 2014/53/EUDirective 2014/53/EU of the European Parliament and of the Council of 16 April 2014 on the harmonisation of the laws of the Member States relating to the making available on the market of radio equipment and repealing Directive 1999/5/EC.
[i.2]	ITU Radio Regulations (2016 <u>2020</u>).

[i.7]	EUROCAE ED-117A (September 2016): "MOPS for Mode S Multilateration Systems for Use in Advanced Surface Movement Guidance and Control Systems (A-SMGCS)".

3 Definition of terms, symbols and abbreviations

3.1 Terms

For the purposes of the present document, the following terms apply:

conducted measurements: measurements which are made using a wired connection to the EUT

duty cycle: ratio expressed as a percentage, of the cumulative duration of transmissions within an observation interval and the interval itself, as measured in an observation bandwidth

environmental profile: range of environmental conditions under which the EUT is declared by the manufacturer to comply with the provisions of the present document

equipment under test: system of constituents provided by the manufacturer for qualification under the present document

ground based multilateration equipment or ground station: aeronautical station equipment intended for use in an A-<u>-</u>SMGCS multilateration component

NOTE: A ground station can include sensor, interrogator and/or transponder components. A ground station can be fixed or mobile.

inactive state: entire period between transmissions, less 100 µs transition periods preceding and following the transmission

interrogator: aeronautical station equipment including at least one transmitter designed to produce aeronautical mobile service signals at 1 030 MHz

Mode S: particular type of transponder-uplink or downlink message defined in ICAO Annex 10, Volume IV [1]

multilateration: surveillance technique which provides position derived from the secondary surveillance radar Secondary Surveillance Radar (SSR) transponder signals (replies or squitters) primarily using time difference of arrival Time Difference Of Arrival (TDOA) techniques

NOTE: Additional information, including identification, can be extracted from the received signals.

Operating Channel (OC): frequency range in which the transmission from the EUT occurs, or in which the EUT is intended to receive transmissions

operating frequency: centre of the OC

out of band emissions: power transmitted at frequencies outside the OC but within the specified spectral mask

probability of detection: rate of correctly received and decoded squitter messages

receiver: EUT which includes the capability to convert RF signals into binary content

resolution bandwidth: bandwidth that is used for measurements used for spectral measurements

sensor: aeronautical station equipment including at least one receiver designed to receive aeronautical mobile service signals at 1 030 MHz and/or 1 090 MHz

spurious emissions: power transmitted at frequencies below or above the Out-of-Band domain

NOTE: Spurious emissions include harmonic emissions, parasitic emissions, intermodulation products and frequency conversion products, but exclude Out of Band emissions.

transmission: radio emission consisting of one uplink or downlink Mode S message

transmitter: EUT which includes the capability to convert binary content into RF signals

transponder: aeronautical station equipment including at least one transmitter designed to produce aeronautical mobile radionavigation service signals at 1 090 MHz and zero or more receivers designed to receive aeronautical mobile radionavigation service signals at 1 030 MHz

unwanted signal: any signal other than the wanted signal or as described in a specific test case

wanted signal: in-band signal modulated according to the Mode specification

NOTE: Some manufacturers may also accept Mode 3A/C and other modulations which is beyond the scope of the present document.

3.2 Symbols

For the purposes of the present document, the following symbols apply:

dB decibel

dBc dB relative to carrier

dBm power in dB relative to 1 milliwatt

dBpp dB below PEP

f measurement frequency

μs Microsecond

 Ω Ohm

PD Probability of Detection

3.3 Abbreviations

For the purposes of the present document, the following abbreviations apply:

AC	Alternating Current
ADS-B	Automatic Dependant Surveillance Broadcast
A-SMGCS	Advanced Surface Movement Guidance and Control System
AVOL	Aerodrome Visibility Operational Level
CRC	Cyclic Redundancy Check
CW	Continuous Wave
DC	Direct Current
DF	Downlink Format
DME	Distance Measuring Equipment
EUT	Equipment Under Test
ICAO	International Civil Aviation Organization
MLAT	Multilateration
MOPS	Minimum Operational Performance Specification
NA	Not Applicable
NA	Not Applicable
OC	Operating Channel
OOB	Out Of Band
PD	Probability of Detection
PEP	Peak Envelope Power
RBW	Reference BandWidth
RF	Radio Frequency
RMS	Root Mean Square
RX	Receive
SSR	Secondary Surveillance Radar
TX	<u>Transmit</u>
VBW	Video BandWidth

4 Technical requirements specifications

4.1 Environmental profile

The technical requirements of the present document apply under the environmental profile for operation of the equipment, which shall be declared by the manufacturer in accordance to the environmental requirements stated in EUROCAE ED 117A [2], Chapter 4 (Requirements [REQ 73.] to [REQ 78.]).in accordance with its intended use but, as a minimum, shall be that specified in the test conditions contained in the present document. The equipment shall comply with all the technical requirements of the present document at all times when operating within the boundary limits of the declared operational environmental profile defined by its intended use.

4.2 Conformance Requirements

4.2.1 Applicability

4.2.1.1 Equipment with and without integral antenna

For the purposes of conducted measurements on an EUT, a 50 Ω connection point shall be provided for test purposes.

For EUT with integral antenna, the connection point shall correspond to the input of the integral antenna.

4.2.1.2 Equipment with multiple functions

Any ground station which includes the interrogator function shall comply with the requirements in clause 4.2.2-to clause 4.2.5.

Any ground station which includes the receiver function shall comply with the requirements in clause 4.2.6 to clause 4.2.123.

4.2.2 Transmitter operating requirements

4.2.2.1 Operating frequency and frequency error

4.2.2.1.1 Definition

The operating frequency is the nominal value of the carrier frequency.

The frequency error is the difference between the actual carrier frequency and its nominal value of 1 030 MHz.

4.2.2.1.2 Limits

The nominal value of carrier frequency of the interrogation and control transmissions shall be 1 030 MHz.

The absolute value of the frequency error shall not exceed 0,01 MHz-as specified in ICAO Annex 10, Volume IV [1], clause 3.1.2.1.1.

NOTE: This limit is <u>specified in ICAO Annex 10</u>, <u>Volume IV [1]</u>, <u>clause 3.1.2.1.1 and is stricter than the requirement defined in the ITU Radio Regulations [i.2i.2]</u>, Appendix 2.

4.2.2.<u>1.</u>3 Conformance

The conformance tests for this requirement shall be as are defined in clause 5.43.1.

4.2.32.2 Spectrum mask

4.2.32.2.1 Definition

A spectrum mask is a set of limit lines applied to a plot of a transmitter spectrum. The purpose is to constrain emissions at frequencies in the Out of Band domain which lies immediately outside the intended Operating Channel.

The Out of Band domain extends to \pm -125 MHz from the nominal operating actual carrier frequency of 1 030 MHz. The frequencies outside the Out of Band domain are defined as the spurious domain.

The definition of the spectrum mask is chosen as an alternative method to the specification of Out of Band domain emissions.

4.2.32.2.2 Limits

The measured spectrum shall be below the limit lines shown in Figure 1.

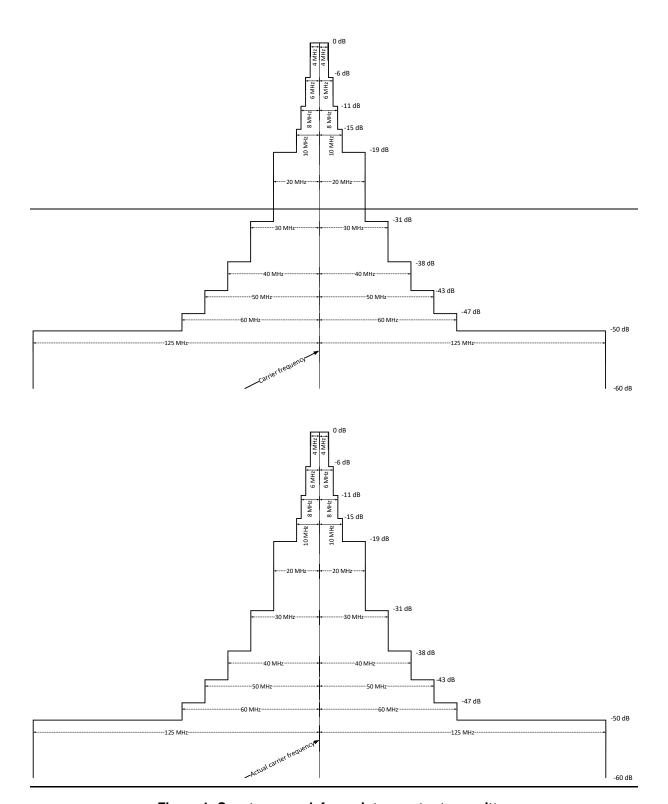

Figure 1: Spectrum mask for an interrogator transmitter

NOTE: The spectrum mask specified in ICAO Annex 10, Volume 4 [1], Figure 3-2 has been modified in order to be consistent with the ITU Radio Regulations [i.2i.2], Appendix 3. The ICAO mask was extrapolated from the last three steps to determine when the mask would intercept the -60 dB point. A value of approximately 125 MHz was reached. 125 MHz is also the point reached when extrapolating the mask from the -40 dB (i.e. 40 MHz) by -40 dB per decade, which is the design objective for the 60 dBpp systems reflected in ECC-REC/Recommendation (02)-05 [i.4i.4], Table 3 until the spurious limit is reached. This is also reflected in ECC-REC/Recommendation (02)05 [i.4], Figure A2.1, item a), the Emission Mask for radars.

4.2.<u>2.2.</u>3.3 Conformance

The conformance tests shall be as for this requirement are defined in clause 5.43.2.

4.2.4<u>2.3</u> Residual Power Output

4.2.4<u>2.3</u>.1 Definition

The residual power output is the power output when not in the active state (i.e. between transmissions).

4.2.4<u>2.3</u>.2 Limits

The residual power output shall be not greater than 47 dBm above 1 GHz and 57 dBm at and below 1 GHz as exceed the limits specified in ERC Recommendation 74 01 [3], Annex 5, Table 151.

Table 1: Limits and measurement bands for the residual power output

Frequency Range	<u>Limits</u>	
9 kHz ≤ f ≤ 1 000 MHz	<u>-57 dBm</u>	
1 000 MHz < f ≤ 6 000 MHz (see note 1)	<u>-47 dBm</u>	
NOTE 1: The upper band measurement limit corresponds to the 5 th harmonic (5 150 MHz) as		
defined in ERC/Recommendation 74-01 [i.6], Table 1 plus a margin.		
NOTE 2: These limits are specified in ERC/Recommendation 74-01 [i.6], Table 2.		

4.2.42.3.3 Conformance

The conformance tests for this requirement shall be as are defined in clause 5.4.3.3.

4.2.52.4 Spurious emissions of transmitter in active mode

4.2.52.4.1 Definition

Spurious emissions are unwanted emissions in the spurious domain. For active transmitters, the spurious domain is all frequencies apart from the operating channel and the Out-of-Band domain.

4.2.5.2.4.2 Limits

The power of any unwanted emission in the spurious domain shall not exceed $\frac{-13 \text{ dBm}43 + 10 \cdot \log \text{ (PEP)}}{100 \cdot \log \text{ (PEP)}}$ or 60 dB below PEP (whichever is less stringent) as in the frequency range defined in Table 2.

NOTE 1: For PEP \leq 50 W, the limit is equal to -13 dBm.

Table 2: Measurement bands for the emissions in the spurious domain

Lower band	Upper band		
9 kHz ≤ f < 905 MHz (see note 1, note 3)	1 155 MHz < f ≤ 6 000 MHz (see note 2, note 4)		
NOTE 1: The lower band measurement limits are defined in ERC/Recommendation 74-01 [i.6].			
NOTE 2: The upper band measurement limit corresponds to the 5 th harmonic (5 150 MHz) as defined in			
ERC/Recommendation 74-01 [i.6], Table 1 plus a margin.			
NOTE 3: The lower edge of the Out-of-Band Domain equa	ils f _c - 125 MHz = 905 MHz.		
NOTE 4: The upper edge of the Out-of-Band Domain equa	als f _c + 125 MHz = 1 155 MHz.		

NOTE 2: These limits are specified in ERC Recommendation 74-01 [3], Annex 5, Table 15-the ITU Radio Regulations [i.2], Appendix 3.

4.2.52.4.3 Conformance

The conformance tests for this requirement $\frac{\text{shall be as are}}{\text{shall be as are}}$ defined in clause 5.43.4.

4.2.64.2.2.5 Transmitter Intermodulation attenuation

4.2.2.5.1 Definition

The transmitter intermodulation attenuation is a measure of the capability of a transmitter to inhibit the generation of signals in its non-linear elements caused by the presence of the transmitter power and an interfering signal entering the transmitter via its antenna. It is expressed by the intermodulation attenuation ratio specified as the ratio, in dB, of the PEP level to the power level of the third order intermodulation product.

4.2.2.5.2 Limits

The intermodulation attenuation ratio shall be at least 50 dB in the presence of an external unmodulated CW signal at a power level of +20 dBm or PEP -30 dB (whichever is lower) within a frequency range from 960 MHz to 1 215 MHz.

4.2.2.5.3 Conformance

The conformance tests for this requirement are defined in clause 5.3.5.

4.2.2.6 Transmitter time domain characteristics

4.2.2.6.1 Definition

The transmitter function is able to transmit different signal types, each one consisting of a series of modulated pulses.

Each pulse of the sequence has specific characteristics in terms of shape and timing in the sequence.

4.2.2.6.2 Limits

The transmitter shall fulfil the requirements as indicated in Table 3 and Table 4 (see also Figure 2).

Table 3: 1 030 MHz Mode S pulse shape

Dulco	Pulse length	Duration (µs)	Rise Ti	me (µs)	Decay T	ime (µs)
<u>Pulse</u>	Min	Max	Min	Max	Min	Max
<u>P1, P2</u>	0,71	0,89	0,05	0,1	0,05	0,2
<u>P6</u>	16,05	16,4 <u>5</u>	0,05	0,1	0,05	0,2
Phase reversal		0,08			_	
NOTE: This table	is derived from	ICAO Annex 10	0, Volume	IV [1], sect	tion 3.1.2.1	<u>1.7.</u>

Table 4: 1 030 MHz Mode S pulse spacing

Bulgos	Pulse spacing (µs)		
<u>Pulses</u>	Min	Max	
P2 to P1 delay	1,96	2,04	
P6 to sync phase reversal delay	1,21	1,29	
NOTE: This table is derived from ICAO Annex 10, Volume IV [1], section 3.1.2.1.5.2			
and section 3.1.2.1.4.2.1.			

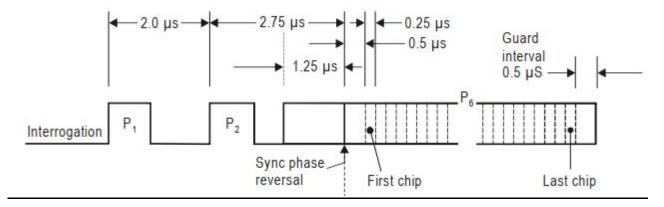

Figure 2: Pulse sequence of a 1 030 MHz Mode S Interrogation

4.2.2.6.3 Conformance

The conformance tests are specificied in clause 5.3.6.

4.2.3 Receiver requirements

4.2.3.1 Sensitivity variation over the operating frequency range

4.2.63.1.1 Definition

The receiver sensitivity ishas the ability to receive a wanted signal at low input signal levels while providing a pre-<u>-</u>determined level of performance. The operating frequency range is the frequency range around the nominal operating frequency over which reception of signals can be achieved.

4.2.63.1.2 Limits

The sensitivity shall not degrade by more than 3 dB as the incoming signal is offset by a tolerance of 1 MHz.

4.2.63.1.3 Conformance

The conformance tests shall be as for this requirement are defined in clause 5.54.1.

4.2.73.2 RF selectivity and spurious response rejection

4.2.73.2.1 Definition

RF selectivity and spurious response rejection are the ability of the EUT to avoid erroneous reception of signals from outside the desired frequency band.

Limits are evaluated assuming the signal is constructed as a valid Mode S waveform except that the frequency is altered. Although a 1 090 MHz system has only a single frequency channel, DME systems may occupy adjacent frequency allocations within the aviation band. It is important that the receiver rejects signals which are out of band while retaining sufficient bandwidth for acceptable multilateration performance.

4.2.73.2.2 Limits

The EUT shall reject signals such that the signal level of a valid message shall be increased by at least the value given for the frequency offset in Table 45 before the signal is received with a probability the same Probability of 90 %.detection or less.

EXAMPLE: The EUT receives a valid signal at 1 090 MHz with 90 % P_d at a level of -85 dBm. With a frequency offset of 19 MHz, the same probability of detection may be achieved only if the injected signal has a level of at least -65 dBm (20 dB higher). This shows that the receiver has at least 20 dB of rejection at the 19 MHz frequency offset.

NOTE 1: The limits were derived from receiver Out-of-Band rejection characteristics that are used within the industry for receivers that are used for both ADS-B and multilateration.

NOTE 2: These limits use valid Mode S signals in order to be a more stringent requirement for the receiver rejection.

Table 1:5: Minimum rejection level for messages

Frequency Offset (MHz) with respect to the operating frequency	Minimum Rejection level (dB)
$\pm 12,5-19 < f \le -12,5 \text{ and } +12,5 \le f < +19$	3
± 19-29 < f ≤ -19 and +19 ≤ f < +29	20
± 29-46 < f ≤ -29 and +29 ≤ f < +46	40
±-f ≤ -46 and f ≥ +46	60

EXAMPLE: Assume the EUT receives a valid signal at 1 090 MHz with 90 % PD at a level of 80 dBm.

A similar signal offset by 19 MHz would need to be injected at least 20 dB higher (i.e. ≥ 60 dBm) before the same 90 % PD was achieved. This shows that the receiver has at least 20 dB of rejection at the 19 MHz frequency offset.

4.2.73.2.3 Conformance

The conformance tests for this requirement shall be asare defined in clause 5.5.2.

4.2.8

4.2.3.3 Inter-modulation response rejection

4.2.83.3.1 Definition

The intermodulation response rejection is a measure of the capability of the receiver to receive a wanted modulated signal without exceeding a given degradation due to the presence of two or more unwanted signals with a specific frequency relationship relative to the receiver frequency.

4.2.83.3.2 Limits

At any frequency combination from -78 MHz to -20 MHz and from +20 MHz to +78 MHz from the receiver frequency of 1 090 MHz, the unwanted signals shall not reduce the probability of detection by more than 5 percentage points if their signal level is 40 dB above the reference sensitivity.

4.2.83.3.3 Conformance

The conformance tests for this requirement shall be as defined in clause 5.5.3.

4.<u>3.</u>

4.2.93.4 Co-channel rejection

4.2.93.4.1 Definition

Co-channel rejection is the receiver's ability to receive a wanted signal in the presence of an unwanted signal, with both the signals being at the nominal receiver frequency. An unwanted signal is a signal that has a signal level 12 dB or more below the level of the wanted signal.

4.2.93.4.2 Limits

The unwanted An unwanted signal with a level of 12 dB below the level of the wanted signal shall not reduce the rate of correctly received and decoded wanted Mode S signals by more than 5 percentage points.

4.2.93.4.3 Conformance

The conformance tests for this requirement shall be asare defined in clause 5.54.4.

4.2.103.5 Blocking

4.2.103.5.1 Definition

Blocking is a measure of the capability of the receiver to receive a wanted signal without exceeding a given degradation due to the presence of a strong unwanted signal.

4.2.103.5.2 Limits

The rate of correctly received and decoded wanted Mode S signals shall be reduced by no more than 5 percentage points in the presence of unwanted signals specified in Table $2\underline{6}$.

Table 2:6: Unwanted signal characteristics

Frequency range	Level		
1 090 MHz - 78 MHz to 1 090 MHz - 15 MHz	20 dB above the level of the wanted signal		
1 090 MHz + 15 MHz to 1 090 MHz + 78 MHz 20 dB above the level of the wanted signal			
NOTE: The level of the wanted signal is defined in clause 5.54.5.4.			

4.2.103.5.3 Conformance

The conformance tests for this requirement shall be asare defined in clause 5.54.5.

4.2.113.6 Sensitivity

4.2.113.6.1 Definition

The receiver sensitivity is the ability to receive a wanted signal at low input signal levels while providing a pre-_determined level of performance.

4.2.113.6.2 Limits

Receivers shall operate for signals with a carrier frequency of 1 090 MHz with a PD of not less than 90 % at a desired signal level of -72 dBm.

NOTE: This number reflects a <u>numbersensitivity</u> for surveillance systems in order to support the requirements for Probability of Target Reports in EUROCAE ED-117A [<u>i.</u>7].

4.2.113.6.3 Conformance

The conformance tests for this requirement shall be asare defined in clause 5.54.1.

4.2.123.7 Receiver spurious emissions

4.2.123.7.1 Definition

Spurious emissions are unwanted emissions in the spurious domain. For Receivers the spurious domain is all frequencies, as they are not supposed to transmit any signal.

4.2.123.7.2 Limits

The power of any unwanted emission in the spurious domain shall not exceed 47 dBm above 1 GHz and 57 dBm at and below 1 GHz as the limits specified in ERC/Recommendation 74-01 [3], Annex 5, Table 157.

Table 7: Limits and measurement bands for the receiver spurious emissions

Frequency Range	<u>Limits</u>			
9 kHz ≤ f ≤ 1 000 MHz	<u>-57 dBm</u>			
1 000 MHz < f ≤ 6 000 MHz (see note 1)	<u>-47 dBm</u>			
NOTE 1: The upper band measurement limit corresponds to the 5 th harmonic (5 150 MHz) as				
defined in ERC/Recommendation 74-01 [i.6], Table 1 plus a margin.				
NOTE 2: These limits are specified in ERC/Recommendation 74-01 [i.6], Table 2.				

4.2.123.7.3 Conformance

The conformance tests for this requirement shall be asare defined in clause 5.4.6.

4.2.3.8 Receiver dynamic range

4.2.3.8.1 Definition

The receiver dynamic range is the ability to receive a wanted signal across a range of signal levels while providing a pre-determined level of performance. The minimum signal level is defined as the receiver sensitivity specified in clause 4.2.3.6, which sets the maximum detectable distance in an A-SMGCS environment. The receiver dynamic range ensures continuous coverage up to near proximity, which determines the maximum signal level of continued coverage.

4.2.3.8.2 Limits

Receivers shall operate for signals with a carrier frequency of 1 090 MHz with a PD of not less than 90 % for signal levels that range from the defined sensitivity (-72 dBm) to a desired signal level of -2 dBm. This corresponds to a dynamic range of 70 dB.

4.2.3.8.3 Conformance

The conformance tests for this requirement are defined in clause 5.64.7.

5 Testing for compliance with technical requirements

5.1 Environmental conditions for testing

5.1.1 General requirements

Tests defined in the present document shall be carried out at representative points within the boundary limits of the declared operational environmental profile defined by its intended use, which, as a minimum, shall be that specified in the test conditions contained in the present document.

Where technical performance varies subject to environmental conditions, tests shall be carried out under a sufficient variety of environmental conditions (within the boundary limits of the declared operational environmental profile) as specified in the present document to give confidence of compliance for the affected technical requirements.

5.1.2 Procedure for Tests Test Conditions

5.1.2.1 All Equipment Thermal Balance

Before measurements are made, the equipment shall have reached thermal balance in the test chamber. The equipment shall be switched off during the temperature stabilizing period. In the case of equipment containing temperature stabilization circuits designed to operate continuously, the temperature stabilization circuits may be switched on for 15 minutes after The thermal balance has been obtained, the equipment shall then meet the specified requirements. If the thermal balance is not shall be checked by temperature measurements, a temperature stabilizing period of at least one hour shall be allowed. The sequence of measurements shall be chosen, and the humidity content in the test chamber shall be controlled so that excessive condensation does not occur.

5.1.2.2 Equipment including Transmitters

Before tests at the upper temperature, the equipment shall be placed in the test chamber and left until. When the equipment temperature is not changing more than 1 K per minute thermal balance is attained. The equipment shall then be switched on in the transmit state for a period of 30 minutes after which the equipment shall meet the specified requirements reached.

5.<u>1.</u>2 <u>Interpretation.2 Normal Test Conditions</u>

5.1.2.2.1 Temperature and humidity

For equipment intended to be operated indoors (partly temperature-controlled locations as defined in clause 4.2 of ETSI EN 300 019-1-3 [3]), the measurement results temperature and humidity conditions for tests shall be a combination of temperature and humidity as defined in ETSI EN 300 019-1-3 [3], clause 4.2, Figure 2 (Climatogram for class 3.2).

The interpretation of the results recorded in a test report for the measurements described in the present document shall be as follows:

the measured value related to For equipment intended to be operated in an on-site equipment room (temperature-controlled locations as defined in clause 4.1 of ETSI EN 300 019-1-3 [3]), the temperature and humidity conditions for tests shall be a combination of temperature and humidity as defined in ETSI EN 300 019-1-3 [3], clause 4.1, Figure 1 (Climatogram for class 3.1).

For equipment intended to be operated outdoors (on-site outdoors locations), the temperature and humidity conditions for tests shall be a combination of temperature and humidity as defined in ETSI EN 300 019-1-4 [4], clause 4.1, Figure 1 (Climatogram for class 4.1).

The actual values during the tests shall be recorded in the test report.

<u>5.1.2.2.2</u> Power supply

The power supply for testing shall be the corresponding limit will be used to decide whether an equipment meets nominal mains voltage. For the requirements purpose of the present document; the nominal voltage shall be the declared voltage or any of the declared voltages for which the equipment was designed.

The actual values during the value of tests shall be recorded in the measurement uncertainty test report.

5.1.2.3 Extreme Test Conditions

5.1.2.3.1 Temperature and humidity

For equipment intended to be operated in an on-site equipment room (temperature-controlled locations as defined in clause 4.1 of ETSI EN 300 019-1-3 [3]), measurements shall be made at the lowest and highest temperatures as defined in ETSI EN 300 019-1-3 [3], clause 4.1, Figure 1 (Climatogram for the measurement class 3.1) and Table 1 (class 3.1, normal).

For equipment intended to be operated indoors (partly temperature-controlled locations as defined in clause 4.2 of each parameter shall be included ETSI EN 300 019-1-3 [3]), measurements shall be made at the lowest and highest

temperatures as defined in ETSI EN 300 019-1-3 [3], clause 4.2, Figure 2 (Climatogram for class 3.2) and Table 1 (class 3.2).

For equipment intended to be operated outdoors (on-site outdoors locations), measurements shall be made at the lowest and highest temperatures as defined in ETSI EN 300 019-1-4 [4], clause 4.1, Figure 1 (Climatogram for class 4.1) and Table 1 (class 4.1).

The actual values during the tests shall be recorded in the test report.

A device capable of operating in more than one of these environments only needs to be tested for the most extreme environment.

5.1.2.3.2 Power supply

The power supply for testing shall be the nominal mains voltage ± 10 % (for AC power supply) or ± 20 % (for DC power supply). For the purpose of the present document, the nominal voltage shall be the declared voltage or any of the declared voltages for which the equipment was designed.

For an AC power supply, the maximum frequency offset of the nominal mains frequency shall be 2 Hz.

The actual values during the tests shall be recorded in the test report.

5.32 Test and General Conditions

5.32.1 Transmitter test signals

5.32.1.1 General Considerations

For the purposes of the present document a transmitter test signal is a modulated carrier generated by the EUT to facilitate a particular test. The EUT shall be capable of generating the following test signals:

- Test signal 1:—Maximum duty cycle, short Mode S interrogations with all "0" data content see clause- 5.32.1.2.
- Test signal 2:—Maximum duty cycle, short Mode S interrogations with all "1" data content see clause-5.32.1.3.

Test signals may be generated autonomously by the EUT when configured for test mode, or by applying external commands or other stimulation. Operation in a test mode may involve suitable temporary internal modifications of the EUT or the use of special software. Details of the method chosen and the test signals shall be recorded in the test report.

5.32.1.2 Test signal 1

When test signal 1 is specified below, a signal shall be generated with the following characteristics:

- Transmission rate: Maximum constant rate such that the rated maximum duty cycle is not exceeded.
- Waveform: Short Mode S Interrogation as defined in ICAO Annex 10, Volume 4 [1], clause 3.1.2.1 and clause 3.1.2.11.4.
- Frequency: 1 030 MHz.
- Message content: All "0" (i.e. the minimum number of phase transitions).
- Amplitude: Maximum rated power level <u>unless otherwise specified by the test</u>.

NOTE: The following As an example shows, the calculation of the transmission rate for a rated maximum duty cycle of 1 %. The is as follows: the short Mode S interrogation contains the P1, P2 and P6 pulses as defined in ICAO Annex 10, Volume 4 [1], Figure 3-4. The cumulative time from the 50 % point of the rising edge of P1 to the 50 % point on the falling edge of P6 is 19,75 microseconds. The maximum transmission rate that does not exceed 1 % (i.e. 10 milliseconds per second of transmission time) is 506 Hz.

5.32.1.3 Test signal 2

When test signal 2 is specified below, a signal shall be generated with the following characteristics:

- Transmission rate: Maximum rate such that the rated maximum duty cycle is not exceeded.
- Waveform: Short Mode S Interrogation as defined in ICAO Annex 10, Volume 4 [1], clause 3.1.2.1 and clause 3.1.2.11.4.
- Frequency: 1 030 MHz.
- Message content: All "1" (i.e. the maximum number of phase transitions).
- Amplitude: Maximum rated power level unless otherwise specified by the test.

5.32.2 Simulated received signals

5.32.2.1 General Considerations

For the purposes of the present document a receiver test signal is an unmodulated or modulated carrier applied to the EUT to facilitate a particular test. The EUT shall be capable of tolerating the following test signals are used:

- Test signal 3: Modulated Mode S Extended Squitter message (desired signal) see clause 5.32.2.2.
- Test signal 4: Modulated Mode S Extended Squitter message (undesired signal) see clause 5.2.2.3.2.3
- Test signal 5: Unmodulated CW signal (undesired signal) see clause 5.2.2.4.

When multiple test signals are used in the same test, the frequency sources for each test signal shall be non-coherent.

The EUT shall be able to report each message received. The report shall include the complete Mode S message and the time of receipt at the receiver or the recording device with at least 10 millisecond resolution. Message reports from multilateration receivers can generally be collected using a computer and standard communication network analysis software. Operation of the EUT in a test mode is permissible and may involve suitable temporary internal modifications of the EUT or the use of special software. Details of the method chosen and how the reports were collected shall be recorded in the test report.

5.32.2.2 Test signal 3

When test signal 3 is specified below, a signal shall be injected with the following characteristics:

- Transmission rate: 100 Hz, unless otherwise specified by the test.
- Waveform: Mode S Extended squitter as defined in ICAO Annex 10, Volume 4 [1], clause 3.1.2.2.
- Frequency: 1 090 MHz, unless otherwise specified by the test.
- Message content: Arbitrary data content with a known Aircraft Address and valid CRC.
- Amplitude: As specified by the test.
- Pulse on/off ratio: At least 40 dB.

EXAMPLE: 0x88234567125054D4C72CF4 is a valid DF-17 squitter with the Aircraft Address of "234567".

5.<u>32</u>.2.3 Test signal 4

When test signal 4 is specified below, a signal shall be injected with the following characteristics:

- Transmission rate: 6 000 Hz.
- Waveform: Mode S Extended squitter as defined in ICAO Annex 10, Volume 4 [1], clause 3.1.2.2.

- 23
- Frequency: As specified by the test.
- Message content: Arbitrary data content with a known Aircraft Address and valid CRC.
- Amplitude: As specified by the test.
- Pulse on/off ratio: At least 40 dB.

NOTE: The data content is distinct from Test signal 3.

EXAMPLE: 0x90BADBADC1123480101D00675B4B is a valid DF-18 squitter with the Aircraft Address of "BADBAD".

5.<u>2.2.</u>4 <u>Test signal 5</u>

When test signal 5 is specified below, a signal shall be injected with the following characteristics:

- Waveform: Continuous wave.
- Frequency: As specified by the test.
- Amplitude: As specified by the test.

5.3 Transmitter tests

5.43.1 Operating frequency and frequency error

5.43.1.1 Description

The purpose of this test is to establish that the transmitter is operating at the correct frequency and within the required frequency error. All tests are performed at the maximum rated transmit power and duty cycle to show that the frequency is correct under these conditions.

5.43.1.2 Test conditions

The EUT shall be configured to generate test signal 1 as indicated in the procedure.

The measurement shall be performed with the EUT operating at its maximum rated power level according to clause 5.1.2.2 and clause 5.1.2.3.

The Spectrum Analyser shall have a frequency error (uncertainty) not exceeding 1 ppm.

NOTE: The test procedure ignores frequency excursions during the phase reversal. Further information is given in ICAO Annex 10, Volume IV [1], clause 3.1.2.1.1.

5.43.1.3 Method of measurement

The measurement shall be a conducted measurement using ause the connection to the EUT antenna interface.

Unless otherwise noted below, the spectrum analyser shall be configured to the following settings:

- Trigger level: As appropriate for input power and attenuation.
- Trace properties: Normal (e.g. not max hold).
- Sweep properties: As needed to capture a waveform without interruptions due to duty cycle.

The test setup shall be as in Figure 3.

Figure 3: Test setup for operating frequency and frequency error

5.3.1.4 Measurement procedure

The test procedure shall be as follows:

- 1) Attach the EUT antenna port to the spectrum analyser as shown in Figure 3. The attenuation of the attenuator shall be such that the power level is in the working range of the spectrum analyser.
- 2) Configure the EUT to produce test signal 1 at the maximum rated power level and maximum duty cycle.
- 3) Set up the spectrum analyser with a resolution bandwidth of 30 kHz and a video bandwidth of 100 kHz.
- 4) Measure the frequency of the peak of the spectrum and verify that the measured value does not exceed the limits specified in clause 4.2.2.1.2.

5.3.2 Spectrum mask

5.3.2.1 Description

The in band and Out of Band domains are measured for compliance of the EUT with the spectrum mask.

5.3.2.2 Test conditions

The EUT shall be configured to generate test signal 1 and test signal 2 as indicated in the procedure.

The measurement shall be performed with the EUT operating at its maximum rated power level and minimum rated power level.

The measurement shall be performed according to clause 5.1.2.2 and clause 5.1.2.3.

The test shall be performed at the maximum rated duty cycle.

5.3.2.3 Method of measurement

The measurement shall use the connection to the EUT antenna interface.

Unless otherwise noted below, the spectrum analyser shall be configured to the following settings:

- Trigger level: As appropriate for input power and attenuation.
- Trace properties: Normal (e.g. not max hold).
- Sweep properties: As needed to capture a waveform without interruptions due to duty cycle.

5. The test setup shall be as in Figure 4.1

Figure 4: Test setup for spectrum mask

5.3.2.4 Measurement procedure

The test procedure shall be as follows:

- 1)—Attach the EUT antenna port to the spectrum analyser with appropriate attenuation.
- 1) Configure the EUT to produce test signal 1 at an attenuator such that the power level is in the working range of the spectrum analyser.
- <u>1)2)</u> Configure the EUT to produce test signal 1 at the power level corresponding to the maximum rated power level and <u>maximum</u> duty cycle.
- 2)—Set up the spectrum analyser with a receiver bandwidth of 1 kHz and a video bandwidth of 1 kHz.
- 3) Measure the frequency of the peak of the spectrum and compare to limits defined in clause 4.2.2.2.

5.4.2 Spectrum mask

5.4.2.1 Description

The in band and Out of Band domains are measured for compliance of the EUT with the spectrum mask. All tests shall be performed at the maximum rated transmit power and duty cycle.

5.4.2.2 Test conditions

The EUT shall be configured to generate test signal 1 and test signal 2 as indicated in the procedure.

The measurement shall be performed with the EUT operating at its maximum rated power level, minimum rated power level and at the power level between minimum and maximum power level.

For conformance testing a video bandwidth and resolution bandwidth of 1 MHz for the spectrum analyser shall be used.

5.4.2.3 Method of measurement

The measurement shall be a conducted measurement using a connection to the EUT antenna interface. All amplitudes shall be adjusted for cable loss to be representative of the antenna interface of the EUT.

Care should be taken that the peak level of the signal into the test equipment is not so high as to cause broadening of the spectrum due to non-linear effects in the test equipment.

Unless otherwise noted below, the spectrum analyser shall be configured to the following settings:

- Trigger level: As appropriate for input power and attenuation.
- Trace properties: Normal (e.g. not max hold).
- Sweep properties: As needed to capture a waveform without interruptions due to duty cycle.
- Receiver bandwidth, resolution bandwidth and a video bandwidth: 1 MHz.
- NOTE: ERC Recommendation 74 01 [3] indicates that a spectrum analyser receiver bandwidth of 1 MHz should be used for frequencies of 1 GHz and above, and a bandwidth of 100 kHz should be used below 1 GHz. However, since the spectrum mask of the desired signal spans the 1 GHz boundary, a receiver bandwidth of 1 MHz will be used for frequencies of 905 MHz and above.

5.4.2.4 Measurement procedure

- 4) Attach the EUT antenna port to the spectrum analyser with appropriate attenuation.
- 5) Configure the EUT to produce test signal 1 at the power level corresponding to the rated peak power level and maximum duty cycle.
- 6)3) Set up the spectrum analyser with a receive bandwidth of 1 MHz and a video bandwidth of 13 MHz.
- 7)4) Measure the spectrum from 905 MHz to 1 155 MHz and record the peak amplitude of the spectrum as a reference for 0 dBc.

- 8)5) Switch the EUT to produce test signal 2 at the same power level and duty cycle.
- 9)6) Measure the spectrum from 905 MHz to 1 155 MHz and compare verify that it todoes not exceed the spectrum mask limits defined in clause 4.2.3.22.2.2, taking into account the attenuation of the attenuator and the measured cable losses.
- 7) Repeat steps 1 to 6 setting the power level of the test signals (test signal 1 and test signal 2) to the minimum rated power level.

5.43.3 Residual Power Output

5.4<u>3</u>.3.1 Description

The purpose of this test is to verify that the output power of the transmitter between transmissions, when not in the active state, does not exceed the specified maximum.

5.43.3.2 Test conditions

The EUT shall be ready to transmit, but with no transmissions commanded externally and with no transmissions internally generated.

The measurement shall be performed with the EUT operating at maximum allowed duty cycle or 1 % duty cycle, whichever is lower.

according to clause 5.41.2.2.

5.3.3.3 Method of measurement

The measurement shall be a conducted using a use the connection to the EUT antenna interface. All amplitudes shall be adjusted for cable loss-to.

The test setup shall be representative of the antenna interface of the EUTas in Figure 5.

5.4.3.4 Measurement procedure

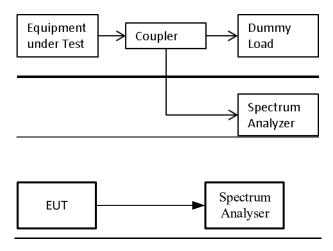

Figure 5: Test setup for residual power output test

5.3.3.4 Measurement procedure

The test procedure shall be as follows:

- 1) Set the EUT so that it is ready to transmit, but no transmissions are generated.
- 1)2) Connect the power measuring equipment spectrum analyser to the EUT antenna connector with appropriate attenuation to keep the power level in the acceptable range for the power measuring equipment.

- 2) Configure the EUT to repeatedly transmit test signal 2.
- 3) Measure Taking into account the power of the output signal over the period between transmissions, starting 100 µs after the end of one interrogation and ending 100 µs prior to the start of the next interrogation. The power is determined by calculating the RMS value of the signal during the measurement time.
- 4)3) Verifymeasured cable losses, verify that the residual power output does not exceed the limit limits specified in clause 4.2.42.3.2 when the spectrum analyser is tuned over the frequency range shown in Table 38 below.

All measurements shall be made with a reference bandwidth as shown in Table 38. The resolution bandwidth of the spectrum analyser shall be equal to the reference bandwidth.

Table 3:8: Reference Bandwidths bandwidths

Frequency Range	RBW	<u>VBW</u>
9 kHz ≤ f < 150 kHz	1 kHz	<u>3 kHz</u>
150 kHz ≤ f < 30 MHz	10 kHz	<u>30 kHz</u>
30 MHz ≤ f <-f _{m1} ≤ 1 000 MHz	100 kHz	<u>300 kHz</u>
f _{m2} 1 000 < f ≤ 5 150 6 000 MHz	1 MHz	<u>3 MHz</u>

NOTE 1: f is the measurement frequency.

NOTE 2: f_{m1} is the lower edge of the Out-of-Band Domain and equals f_c - 125 MHz.

NOTE 3: f_{m2} is the upper edge of the Out of Band Domain and equals f_c + 125 MHz.

NOTE 4: The Out of Band Domain is defined in clause 4.2.3 (Spectrum mask).

NOTE 5: 5 1596 000 MHz corresponds to the 5th harmonic of the Interrogator transmitting at 1 030 MHz- (5 150 MHz) plus a margin.

NOTE 3: The reference bandwidths (RBW) are defined in ERC/Recommendation 74-01 [i.6].

5.43.4 Spurious emissions of transmitter in active mode

5.43.4.1 Description

The spurious domain is all frequencies apart from the channel on which the transmitter is intended to operate and the Out-of-Band domain.

5.43.4.2 Test conditions

The EUT shall be configured and operated in modes representative of normal operation as defined in EUROCAE ED 117A [2], clause 1.6.

Measurements shall be performed with the EUT operating at its maximum operating power level at peakthe maximum duty cycle.

5.4 The measurement shall be performed according to clause 5.1.2.2 and clause 5.1.2.3.

5.3.4.3 Method of measurement

For all EUT the spurious emissions levels shall be established as the conducted measurement procedure in clause 5.4.4.4.

The measurement shall use the connection to the EUT antenna interface. All amplitudes shall be adjusted for cable loss to be representative of the antenna interface of the EUT attenuation of the attenuator and cable losses.

5.43.4.4 Measurement Procedure

5.3.4.4.1 Part 1: Measurement of PEP and determination of spurious emission limit

The antenna port of the EUT test setup shall be connected to the spectrum analyser via an appropriate directional coupler and a dummy load (see as in Figure 3).6.

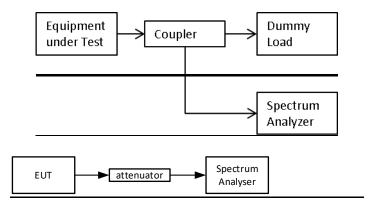

Figure 6: Measurement Arrangement: Test setup for Spurious emissions of transmitter the measurement of EUT PEP

The test procedure shall be as follows:

- 1) Connect the spectrum analyser to the EUT antenna connector with appropriate attenuation to keep an attenuator such that the power level is in the acceptable range forof the spectrum analyser.
- 2) Make the following settings in the spectrum analyser:
 - a) Set RBW to 1 MHz and VBW to 3 MHz (see Table 8).
 - b) Set the centre frequency to the frequency of the peak value of the spectrum.
 - c) Set "frequency span" to zero.
 - d) Set the sweep time to a value equal or greater than the width of the selected pulse.
- 3) Taking into account the attenuation of the attenuator and the measured cable losses, measure the PEP by reading the power value at the crest of the envelope.

As described in clause 4.2.2.4.2, the limit of the spurious emission will be the less stringent between $43 + 10 \cdot \log(PEP)$ and 60 dB below PEP, where PEP is the measured PEP.

<u>5.3.4.4.2</u> Part 2: Spurious emission measurement procedure

The test setup shall be as in Figure 7.

Figure 7: Test setup for spurious emissions of transmitter in active mode

The test procedure shall be as follows:

- 1) Connect the spectrum analyser to the EUT antenna connector with an attenuator such that the power level is in the acceptable range of the spectrum analyser. A 1 030 MHz notch filter is also necessary to avoid intermodulation effects that might be generated by the measurement equipment.
- 2) Tune the spectrum analyser subsequently to the frequency range shown in Table 4.9.
- 3)1) Note the detected power levels at the spectrum analyser.
- 4)3) Compare Taking into account the insertion losses of all components, verify that the power levels todo not exceed the limits limit specified in clause 4.2.2.4.2 and determined as described in clause 5.23.4.4.1.

All measurements shall be made with a reference bandwidth as shown in Table 49. The resolution bandwidth of the spectrum analyser shall be equal to the reference bandwidth.

Table 49: Reference Bandwidths

Frequency Range	RBW	
9 kHz ≤ f < 150 kHz	1 kHz	
150 kHz ≤ f < 30 MHz	10 kHz	
30 MHz ≤ f < f _{m1}	100 kHz	
f _{m2} < f ≤ 5 150 MHz	1 MHz	

NOTE 1: f is the measurement frequency.

NOTE 2: f_{m1} is the lower edge of the Out of Band Domain and equals f_c 125 MHz.

NOTE 3: f_{m2} is the upper edge of the Out-of-Band Domain and equals f_c + 125 MHz.

NOTE 4: The Out-of-Band Domain is defined in clause 4.2.3 (Spectrum mask).

NOTE 5: 5 150 MHz corresponds to the 5th harmonic of the Interrogator transmitting at 1 030 MHz.

At each frequency at which a spurious component is detected, the spurious emission power level shall be noted as the average power level delivered into the dummy load.

5.5

Frequency Range	RBW	<u>VBW</u>
9 kHz ≤ f < 150 kHz	<u>1 kHz</u>	<u>3 kHz</u>
150 kHz ≤ f < 30 MHz	<u>10 kHz</u>	<u>30 kHz</u>
<u>30 MHz ≤ f < f_{m1}</u>	<u>100 kHz</u>	<u>300 kHz</u>
<u>f_{m2} < f ≤ 6 000 MHz</u>	<u>1 MHz</u>	<u>3 MHz</u>

NOTE 1: f is the measurement frequency.

NOTE 2: f_{m1} is the lower edge of the Out-of-Band Domain and equals f_c - 125 MHz.

NOTE 3: f_{m2} is the upper edge of the Out-of-Band Domain and equals f_c + 125 MHz.

NOTE 4: The Out-of-Band Domain is defined in clause 4.2.2.2.2 (Spectrum mask).

NOTE 5: The reference bandwidths (RBW) are defined in ERC/Recommendation 74-01 [i.6].

NOTE 6: 6 000 MHz corresponds to the 5th harmonic of the Interrogator transmitting at

1 030 MHz (5 150 MHz) plus a margin.

5.3.5 Transmitter intermodulation attenuation

5.3.5.1 Description

The purpose of this test is to establish that the transmitter does not generate unwanted signals in the presence of an external signal entering the transmitter via the antenna due to inter-modulation effects in the transmitter's non-linear elements.

5.3.5.2 Test Conditions

External test equipment will be used to create an interfering test signal with amplitudes and frequencies indicated in the procedure. External test equipment will be used for analysing the resulting transmitter output signal.

The interfering test signal shall be test signal 5 (see clause 5.2.2.4).

The measurement shall be performed according to clause 5.1.2.2.

5.3.5.3 Method of Measurement

The measurement shall use the connection to the EUT antenna interface.

The test setup shall be as in Figure 8.

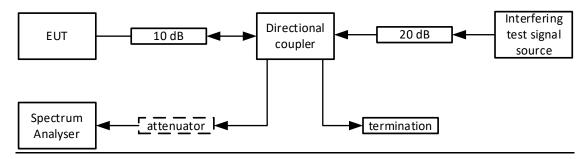

Figure 8: Test setup for transmitter intermodulation attenuation

The transmitter shall be connected to a 10 dB power attenuator and via a directional coupler to a spectrum analyser. An optional attenuator may be required between the directional coupler and the spectrum analyser to avoid overloading the spectrum analyser.

The interfering test signal source is connected to the other end of the directional coupler via a 20 dB power attenuator.

The interfering signal source shall be a signal generator and a linear power amplifier capable of delivering the same output power as the transmitter under test.

The directional coupler shall have an insertion loss of less than 1 dB, a bandwidth of at least 520 MHz and a directivity of more than 20 dB.

The EUT and the test signal source shall be physically separated by at least 2 meters to limit the influence of direct radiation.

5.3.5.4 Measurement Procedure

The test procedure shall be as follows:

- 1) The EUT shall be set to transmit test signal 2 and the spectrum analyser adjusted to give a maximum indication with a resolution bandwidth of 1 MHz and a scan range of 1 030 MHz ± 260 MHz.
- 2) Record the peak of the spectrum as the carrier reference level.
- 3) The power output of the interfering test signal source shall be adjusted to 50 dBm, or the same as the peak of the EUT, whichever is lower (the required 30 dB attenuation is produced by the test setup).
- 4) The interfering signal frequency shall initially be set to 960 MHz and then increased in steps of 1 MHz up to 1 020 MHz.
- 5) The peak of the intermodulation component shall be measured by direct observation on the spectrum analyser and the ratio of the peak level (measured at step 2) to the power level of the largest third order intermodulation product shall be calculated.
- 6) Verify that the inter-modulation attenuation ratio does not exceed the limit specified in clause 4.2.2.5.2.
- 7) Repeat steps 5 and 6 with the interfering test signal source at a frequency starting at 1 040 MHz and then increased in steps of 1 MHz up to 1 215 MHz.

5.3.6 Transmitter time domain characteristics

5.3.6.1 Description

The purpose of this test is to establish that the transmitter produces well-formed Mode S interrogation waveforms that meet the required modulation thresholds.

5.3.6.2 Test Conditions

The measurement shall be performed according to clause 5.1.2.2 and clause 5.1.2.3.

5.3.6.3 Method of measurement

The measurement shall use the connection to the EUT antenna interface.

Pulse length measurements shall be determined by taking the time difference between the 50 % voltage amplitude point on the falling edge of the pulse to the 50 % voltage amplitude point on the rising edge of the pulse.

Pulse rise time measurements shall be determined by taking the time difference between the 90 % voltage amplitude to the 10 % voltage amplitude points on the rising edge of the pulse.

Pulse decay time measurements shall be determined by taking the time difference between the 10 % voltage amplitude to the 90 % voltage amplitude points on the falling edge of the pulse.

<u>Pulse spacing measurements shall be determined by taking the time difference between the 50 % voltage amplitude</u> point on the rising edge of the second pulse to the 50 % voltage amplitude point on the rising edge of the first pulse.

The phase reversal delay measurement shall be determined by taking the time difference between the minimum point of the phase transient amplitude and the 50 % voltage amplitude point on the rising edge of the P6 pulse.

The phase reversal width measurement shall be determined by taking the time difference between the 80 % voltage amplitude points at the phase transient.

The test setup shall be as in Figure 9.

Figure 9: Test setup for time domain characteristics

5.3.6.4 Measurement procedure

The test procedure shall be as follows:

- 1) Attach the EUT antenna port to the peak power meter with an attenuator such that the power level is in the working range of the power meter.
- 2) Configure the EUT to produce test signal 1 at the power level corresponding to the rated peak power level.
- 3) Capture the waveform on the peak power meter.
- 4) Verify that each of the pulse shape parameters is within the thresholds specified in clause 4.2.2.6.2.
- 5) Verify that each of the pulse spacing parameters is within the thresholds specified in clause 4.2.2.6.2.

5.4 Receiver Tests

5.54.1 Sensitivity and Sensitivity variation over the operating frequency range

5.54.1.1 Description

The purpose of this test is to establish that the receiver is operating at the intended frequency and is able to tolerate a certain degree of frequency offset. The receiver sensitivity is also established.

5.54.1.2 Test conditions

External test equipment shall be used to stimulate the EUT with test signal 3 at the amplitudes indicated in the procedure. External test equipment shall be used to collect the reception reports for each injected message.

5.The measurement shall be performed according to clauses 5.1.2.2 and 5.1.2.3.

5.4.1.3 Method of measurement

The test waveform shall be injected using conduction into the EUT antenna interface. All amplitudes shall be adjusted for cable loss to be representative of the antenna interface of the EUT. The message receipt reports losses.

The test setup shall be collected and the average rate of message receipt shall be calculated at each amplitude and as in Figure 10.

Figure 10: Test setup for sensitivity over operating frequency-

5.54.1.4 Measurement procedure

The test procedure shall be as follows:

- 1) Configure the EUT to receive and report messages for recording.
- 2) Configure the recording device to record message reports.
- 3)2) Verify that no message reports are being generated.
- 4)1)—Configure the signal generator to produce test signal 3 at the <u>operating frequency and with the amplitude</u> specified in clause 4.2.113.6.2. Inject at least 1 000 messages per second for at least 100 seconds.
- 5)1) Review the recorded reports to count the number of reports which match the expected message content.
- 6) Divide the number of successfully received messages by the expected number of input messages (i.e. elapsed time multiplied by message rate) and verify that the required PD (clause 4.2-11.2) is achieved.
- 3) (-72 dBm).
- 4) Configure the Network Traffic Analyser to record message reports.
- 5) Inject 1 000 messages per second for at least 100 seconds.
- 6) Review the recorded reports to count the number of reports which match the expected message content.
- 7) Divide the number of successfully received messages by the expected number of input messages (i.e. elapsed time multiplied by message rate) and verify that the required PD as defined in clause 4.2.3.6.2 (at least 90 %) is achieved.
- 7)8) Decrease the signal level in 1 dB steps until the probability of detection is no longer achieved. The lowest amplitude at which the required PD (clause 4.2.113.6.2) is achieved will be used as the reference signal level (i.e. the reference sensitivity) for the following steps and subsequent tests.
- 8) Repeat the test with the signal generator configured to produce test signal 3 with the following modifications:
- 2) a)—Change the signal level of test signal 3 to the reference sensitivity measured in step 8 plus the degradation level specified in clause 4.2.63.1.2-(i.e. add 3 dB).
- b) Change the frequency to Repeat steps 4 to 7 with the signal generator configured to produce test signal 3 to the operating frequency plus the tolerance 1 MHz as specified in clause 4.2.63.1.2.
 - c) Verify that at least the required PD (clause 4.2.11.2) is achieved.
- 11) d) Change the frequency to Repeat steps 4 to 7 with the signal generator configured to produce test signal 3 to the operating frequency minus the tolerance 1 MHz as specified in clause 4.2.63.1.2.
 - e) Verify that at least the required PD (clause 4.2.11.2) is achieved.

5.54.2 RF selectivity and spurious response rejection

5.<u>54</u>.2.1 Description

The purpose of this test is to establish the selectivity of the receiver by measuring the rate of detection of properly formed messages injected outside of the intended operating frequency. The amplitude of injected messages is adjusted to verify that an appropriate number of messages are rejected.

5.54.2.2 Test conditions

External test equipment shall be used to stimulate the EUT with test signal 3 at the amplitudes and frequencies indicated in the procedure. External test equipment shall be used to collect the reception reports for each injected message.

The measurement shall be performed according to clause 5.1.2.2.

5<u>.4</u>.2.3 Method of measurement

The test waveform shall be injected using conduction into the EUT antenna interface. All amplitudes shall be adjusted for cable loss to be representative of the antenna interface of the EUT. The message receipt reports shall be collected and the average rate of message receipt shall be calculated.

The test setup shall be as in Figure 11.

Figure 11: Test setup for RF selectivity

5.54.2.4 Measurement procedure

12) Note the reference sensitivity as determined in the test described in clause 5.5.1 (Sensitivity variation over the operating frequency range).

13)1) Configure the EUT to receive and report messages for recording.

The test procedure shall be as follows:

- Configure the <u>EUT to receive and report messages for recording device to record message reports.</u>
- 2)—Configure the signal generator to produce test signal 3.
- 3) Set the frequency offset from 1 090 MHz according to the first row in clause 4.2.7.2, Table 1.
- 4) Set the amplitude to the reference sensitivity plus the corresponding rejection value in clause 4.2.7.2, Table 1.
- 5)2) Inject at least_a rate of 1 000 messages per second-for at least 100 seconds, -70 dBm, 1 090 MHz.
- 3) ReviewConfigure the recorded Network Traffic Analyser to record message reports to count for a period of at least 10 seconds.
- 6) Evaluate the number of reports which match the expected message content.
- 7)4) 1 090 MHz Probability of Detection (P_d 1 090). Divide the number of successfully received messages by the expected number of input messages (i.e. elapsed time multiplied by message rate).
- 5) Change the signal generator power to -67 dBm, and inject in the EUT test signal 3 at the following frequencies:

1 102,5 MHz, 1 104 MHz, 1 105 MHz, 1 106 MHz, 1 107 MHz, 1 108 MHz,

1 077,5 MHz, 1 076 MHz, 1 075 MHz, 1 074 MHz, 1 073 MHz, 1 072 MHz

- 6) For each of the frequencies at step 5, evaluate the Probability of Detection of the injected scenario (P_d offset) at the injected amplitude.
- 7) Change the signal generator power to -50 dBm, and inject in the EUT test signal 3 at the following frequencies:
 - 1 109 MHz to 1 118 MHz at 1 MHz steps
 - 1 071 MHz to 1 062 MHz at 1 MHz steps
- 8) For each of the frequencies at step 7, evaluate the Probability of Detection of the injected scenario (P_d offset) at the injected amplitude.
- 9) Change the signal generator power to -30 dBm, and inject in the EUT test signal 3 at the following frequencies:
 - 1 119 MHz to 1 135 MHz at 1 MHz steps
 - 1 061 MHz to 1 045 MHz at 1 MHz steps
- 10) For each of the frequencies at step 7, evaluate the Probability of Detection of the injected scenario (P_d offset) at the injected amplitude.
- 11) Change the signal generator power to -10 dBm, and inject in the EUT test signal 3 at the following frequencies:
 - 1 136 MHz to 1 168 MHz at 1 MHz steps
 - 1 044 MHz to 1 012 MHz at 1 MHz steps
- 12) For each of the frequencies at step 11, evaluate the Probability of Detection of the injected scenario (P_d offset) at the injected amplitude.
- 8)—Verify that the probability of detection is no higher than 90 %.
- 9)13) Repeat step 5 through step 10 for the frequency offsets and rejection levels listed test results are in accordance with the requirements specified in clause 4.2.73.2, Table 1..2 (Pd offset \le Pd 1 090).

5.54.3 Inter-modulation response rejection

5.5.4.3.1 Description

The purpose of this test is to establish that inter-modulation caused by two unwanted Out-of-Band signals does not degrade the reception probability when their signal level is below the specified limit.

5.54.3.2 Test conditions

None.

The measurement shall be performed according to clause 5.1.2.2.

5.54.3.3 Method of measurement

The method of measurement is shown in Figure 4 below.

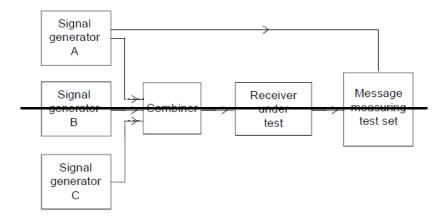

Figure 4: Measurement arrangement

The test waveform shall be injected into the EUT antenna interface.

The test setup shall be as in Figure 12.

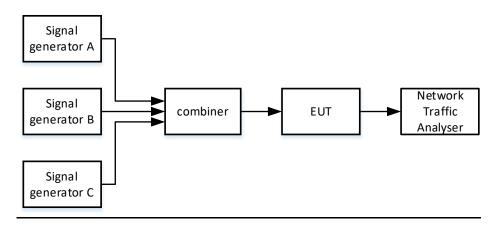

Figure 12: Test setup for intermodulation response rejection

5.54.3.4 Measurement procedure

The measurement procedure shall be as follows:

- 1) Three signal generators, A, B and C, shall be connected to the receiver via a combining network.combiner:
 - The wanted signal, provided by signal generator A, shall be at the nominal frequency of the receiver and shall produce test signal 3.
 - The first unwanted signal, provided by signal generator B, shall be unmodulated and adjusted to a frequency f1 at 20 MHz above the nominal frequency of the receiver.
 - The second unwanted signal, provided by signal generator C, shall be modulated with test signal 4 and adjusted to a frequency f2 at 40 MHz above the nominal frequency of the receiver.
- 2) Initially, signal generators B and C (unwanted signals) shall be switched off (maintaining the output impedance):):
 - The level of the wanted signal from generator A shall be adjusted to the level which is 20 dB above the reference sensitivity measured in the test specified in clause 5.54.1 (Sensitivity variation over the operating frequency range).
- 3) Record the PD of the wanted signal.
- 3) Record the PD of the wanted signal.

- 4) Signal generators B and C shall then be switched on; and set to a level 40 dB above the reference sensitivity measured (see in the test specified in clause 5.54.1) as referenced to the input of the receiver under test.
- 5) Record the PD of the wanted signal.

5)1) Record the PD of the wanted signal.

- 6) Verify that the PD from step 5 is degraded by no more than the limit specified in clause 4.2.83.3.2.
- 7) The measurement shall be repeated with the unwanted signal generator B at the frequency 20 MHz below that of the wanted signal and the frequency of the unwanted signal generator C at the frequency 40 MHz below that of the wanted signal.
- 8) Repeat the test stepsteps 1 to step-7 with at least 3 other of the following frequency combinations that fulfil

 $\underline{\qquad}$ 4 frequencies below fulfilling fc = 2 × f1 - f2

9)8) – (with an offset of f1 and f2 in the range of +-20 MHz to +-78 MHz and --20 MHz to --78 MHz-):

The frequency f2 = 1 030 MHz shall be included since it corresponds to another interrogator.

Since there are potential DME interferers at 1 MHz steps from 962 MHz to 1 213 MHz, any frequency in that range is valid for testing.

EXAMPLES:

- f1 = 1.051, f2 = 1.012 (f2 = 1.090 MHz 78 MHz)
- f1 = 1060, f2 = 1030 (f2 = 1090 MHz 60 MHz)
- $f1 = 1\ 108, f2 = 1\ 126 (f2 = 1\ 090 \text{ MHz} + 36 \text{ MHz})$
- f1 = 1 129, f2 = 1 168 (f2 = 1 090 MHz + 78 MHz)

5. NOTE: The frequency f2 = 1030 MHz is included since it corresponds to another interrogator.

5.4.4 Co-channel rejection

5.54.4.1 Description

This test verifies that the receiver's reception probability is not degraded in the presence of an unwanted modulated signal at the same frequency when its signal level is belowdoes not exceed the limit specified in clause 4.2.93.4.2.

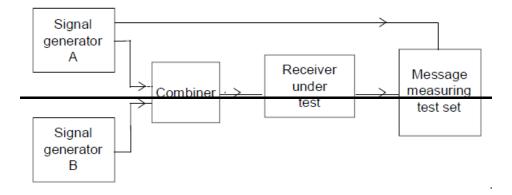

5.5.4.4.2 Test conditions

None.

5.5.4. The measurement shall be performed according to clause 5.1.2.2.

5.4.4.3 Method of measurement

The method of measurement is shown in Figure 5 below.

The test waveform shall be injected into the EUT antenna interface.

The test setup shall be as in Figure 13.

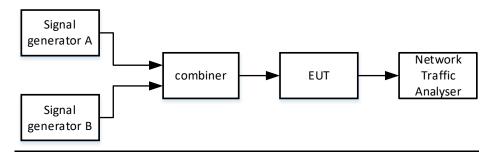

Figure 13: Measurement arrangement: Test setup for co-channel rejection-measurement

5.5.4.4.4 Measurement procedure

The test procedure shall be as follows:

- 1) Two signal generators A and B shall be connected to the receiver via a <u>combining network_combiner</u>. The wanted signal, represented by signal generator A, shall be at the nominal frequency of the receiver and shall <u>have normalbe</u> test <u>modulation</u> (test signal 3)...
- 2) The unwanted signal, represented by signal generator B, shall be modulated withat the nominal frequency of the receiver and shall be a test signal 4.
- 3) Both input signals shall be at the nominal frequency of the receiver under test.
- 4) Initially the unwanted signal shall be switched off (maintaining its output impedance).
- 5) The level of the wanted signal from generator A shall be adjusted to a level which is 20 dB above the reference sensitivity measured in the test specified in clause 5.54.1 (Sensitivity variation over the operating frequency range).
- 6) Record the PD for the wanted signal.
- 7) The unwanted signal from generator B shall then be switched on and its level shall be adjusted to 12 dB below the wanted signal as referenced at the input of the receiver under test.
- 8) Record the PD for the wanted signal.
- 9) Verify that the PD from step 8 is degraded by no more than the limit specified in clause 4.2.93.4.2.
- 10) The measurement shall be repeated for displacements of the unwanted signal $\frac{1.2088.7}{0.000}$ MHz. and $\frac{1.091.3}{0.000}$ MHz.

5.5.5 Blocking

NOTE: ±1,3 MHz is the 3-dB width from ICAO Annex 10, Volume 4 [1], Figure 3-5. It is reasonable to expect the bandwidth of a real co-channel signal to be this wide. For testing, the signal generator bandwidth might be sufficiently narrow that ±1,3 MHz is not actually verified. Therefore, the test is repeated at frequencies 1 088,7 and 1 091,3 MHz.

5.4.5 Blocking

5.54.5.1 Description

With this test it will be verified that a single unwanted Out-of-Band signal cannot degrade the reception probability when its signal level is below the limit specified in clause 4.2.103.5.2.

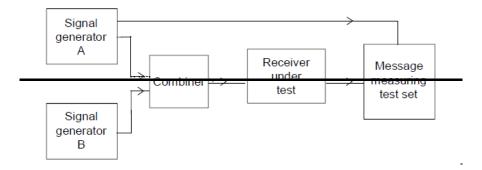

5.54.5.2 Test conditions

None.

The measurement shall be performed according to clause 5.1.2.2.

5.54.5.3 Method of measurement

The method of measurement is shown in Figure 6 below.

The test waveform shall be injected into the EUT antenna interface.

The test setup shall be as in Figure 14.

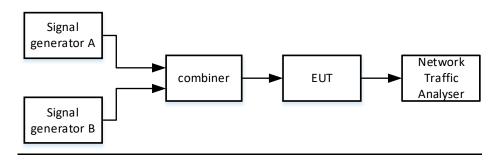

Figure 14: ArrangementTest setup for blocking-measurement

5.54.5.4 Measurement procedure

The test procedure shall be as follows:

- 1) Two signal generators A and B shall be connected to the receiver via a combining networkcombiner.
- 2) The wanted signal, represented by signal generator A, shall be at the nominal frequency of the receiver and shall have normal be a test modulation (test signal 3).

- 3) The unwanted signal, provided by signal generator B, shall be unmodulated continuous wave and at the minimum frequency specified in clause 4.2.103.5.2 (i.e. 1 090 MHz 78 MHz = 1 012 MHz).
- 4) Initially the unwanted signal shall be switched off.
- 5) The level of the wanted signal from generator A shall be adjusted to a level which is 6 dB above the reference sensitivity measured in the test described in clause 5.54.1.

6)1) Record the PD of the wanted signal.

- 6) Record the PD of the wanted signal.
- 7) The unwanted signal shall then be switched on and its level shall be adjusted to the level specified in clause 4.2.103.5.2.

8)1) Record the PD of the wanted signal.

- 8) Record the PD of the wanted signal.
- 9) Verify that the PD from step 8 is degraded by no more than the limit specified in clause 4.2.103.5.2-(i.e. 5%).
- 10) The measurement shall be repeated for frequencies throughout the range defined in clause 4.2.103.5.2 at 1 MHz steps.

5.54.6 Receiver spurious emissions

5.54.6.1 Description

For receivers, or EUT in receive mode, the spurious domain is all frequencies.

5.54.6.2 Test conditions

The EUTmeasurement shall be configured and operated in modes representative of normal operation as defined in EUROCAE ED 117A [2], performed according to clause 5.1.62.2.

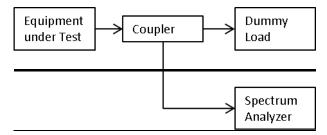

5.54.6.3 Method of measurement

For all EUT the spurious emissions levels The test waveform shall be established as the conducted measurement procedure in clause 5.5.6.4.

<u>injected into the EUT antenna interface.</u> All amplitudes shall be adjusted for cable loss to be representative of the antenna interface of the EUT.

5.5.6.4 Measurement Procedure

The antenna port of the EUT shall be connected to the spectrum analyser via an appropriate directional coupler and a dummy load.

The test setup shall be as in Figure 15.

Figure 15: Measurement arrangement: Test setup for receiver spurious emissions-measurement

5.4.6.4 Measurement Procedure

The test procedure shall be as follows:

- Connect the spectrum analyser to the EUT antenna connector-with appropriate attenuation to keep the power level in the acceptable range for the spectrum analyser.
- 2) Tune the spectrum analyser subsequently to the frequency range shown in Table 510.
- 3) Note the detected power levels at the spectrum analyser.
- 3) Note Taking into account the detected measured cable losses, verify that the power levels at the spectrum analyser.
- 4) Compare the power levels tolevel does not exceed the limits specified in clause 4.2.123.7.2.

All measurements shall be made with a reference bandwidth as shown in Table $5\underline{10}$.

Table 510: Reference Bandwidths

Frequency Range	<u>RBW</u>	<u>VBW</u>	
9 kHz ≤ f < 150 kHz	<u>1 kHz</u>	<u>3 kHz</u>	
<u>150 kHz ≤ f < 30 MHz</u>	<u>10 kHz</u>	<u>30 kHz</u>	
<u>30 MHz ≤ f ≤ 1 GHz</u>	<u>100 kHz</u>	<u>300 kHz</u>	
1 GHz < f ≤ 6 000 MHz	<u>1 MHz</u>	<u>3 MHz</u>	
NOTE 1: f is the measurement frequency.			
NOTE 2: The Reference BandWidths (RBW) are defined in ERC/Recommendation 74-01 [i.6].			

5.4.7 Receiver Dynamic Range

5.4.7.1 Description

The purpose of this test is to establish that the receiver is able to correctly decode input signals with amplitudes across the dynamic range. A -72 dBm sensitivity is established, and detectability is then verified through the dynamic range up to the maximum required amplitude.

5.4.7.2 Test Conditions

External test equipment shall be used to stimulate the EUT with test signal 3 at the amplitudes indicated in the procedure. External test equipment shall be used to collect the reception reports for each injected message.

The measurement shall be performed according to clauses 5.1.2.2 and 5.1.2.3.

5.4.7.3 Method of measurement

The test waveform shall be injected into the EUT antenna interface. All amplitudes shall be adjusted for cable losses. The message receipt reports shall be collected and the average rate of message receipt shall be calculated at each amplitude.

The test setup shall be as in Figure 16.

Figure 16: Test setup for receiver dynamic range

5.4.7.4 Measurement procedure

The test procedure shall be as follows:

- 1) Configure the EUT to receive and report messages for recording.
- 2) Configure the Network Traffic Analyser to record message reports.
- 3) Verify that no message reports are being generated.
- 4) Configure the signal generator to produce test signal 3 at the amplitude specified in clause 4.2.3.6.2 (i.e. the sensitivity level). Inject at least 1 000 messages per second for at least 100 seconds.
- 5) Review the recorded reports to count the number of reports which match the expected message content.

Divide the number of successfully received messages by the expected number of input messages (i.e. elapsed time multiplied by message rate) and verify that the required PD (clause 4.2.Frequency Range	RBW	
9 kHz ≤ f < 150 kHz	1 kHz	
150 kHz ≤ f < 30 MHz	10 kHz	
30 MHz ≤ f ≤ 1 GHz	100 kHz	
1 GHz < f ≤ 5 450 MHz	1 MHz	
NOTE 1: f is the measurement frequency.		
NOTE 2: 5 450 MHz corresponds to the 5 th harmonic of 1 090 MHz		

- 6) At each frequency at which a spurious component is detected, the spurious emission power level shall be noted as the average power level delivered into the dummy load. 3.8.2) is achieved.
- 7) Repeat the test 7 times increasing the signal level of the test signal 3 by 10 dB each time
 (i.e. -62 dBm, -52 dBm, -42 dBm, -32 dBm, -22 dBm, -12 dBm, -2 dBm) and verify that the probability of detection is no less than 90 %.

Annex A (informative): Relationship between the present document and the essential requirements of Directive 2014/53/EU

The present document has been prepared under the Commission's standardisation request C(2015) 5376 final [i.3] to provide one voluntary means of conforming to the essential requirements of Directive 2014/53/EU on the harmonisation of the laws of the Member States relating to the making available on the market of radio equipment and repealing Directive 1999/5/EC [i.1].

Once the present document is cited in the Official Journal of the European Union under that Directive, compliance with the normative clauses of the present document given in Table A.1 confers, within the limits of the scope of the present document, a presumption of conformity with the corresponding essential requirements of that Directive, and associated EFTA regulations.

Table A.1: Relationship between the present document and the essential requirements of Directive 2014/53/EU

	Harmonised Standard ETSI EN 303 213-5-1				
Requirement			Requ	Requirement Conditionality	
No	Description	Essential requirements of Directive	Clause(s) of the present document	U/C	Condition
1	Transmitter operating frequency and frequency error	3.2	4.2.2 <u>.1</u>	С	Equipment with the interrogator function
2	Transmitter spectrum mask	3.2	4.2. 3 2.2	С	Equipment with the interrogator function
თ	Transmitter residual power output	3.2	4.2.4 <u>2.3</u>	С	Equipment with the interrogator function

Key to columns:

Requirement:

No A unique identifier for one row of the table which may be used to identify a requirement.

Description A textual reference to the requirement.

Essential requirements of Directive

Identification of article(s) defining the requirement in the Directive.

Clause(s) of the present document

Identification of clause(s) defining the requirement in the present document unless another document is referenced explicitly.

Requirement Conditionality:

U/C Indicates whether the requirement is unconditionally applicable (U) or is conditional upon the

manufacturer's claimed functionality of the equipment (C).

Condition Explains the conditions when the requirement is or is not applicable for a requirement which is

classified "conditional".

Presumption of conformity stays valid only as long as a reference to the present document is maintained in the list published in the Official Journal of the European Union. Users of the present document should consult frequently the latest list published in the Official Journal of the European Union.

Other Union legislation may be applicable to the product(s) falling within the scope of the present document.

Annex BAnnex B (informative): Maximum measurement uncertainty

The measurements described in the present document are based on the following assumptions:

- the measured value related to the corresponding limit is used to decide whether an equipment meets the requirements of the present document;
- the value of the measurement uncertainty for the measurement of each parameter is included in the test report.

Table B.1 shows the recommended values for the maximum measurement uncertainty figures.

Table B.1: Maximum measurement uncertainty

Parameter	Uncertainty	
Environment measurements		
<u>Temperature</u>	<u>1 °C</u>	
Relative humidity	<u>5 %</u>	
Mains Supply Voltage	<u>±2 %</u>	
Transmitter measurements		
Frequency	<u>±1 ppm</u>	
<u>Transmitter power</u>	<u>±1,5 dB</u>	
Out-of-Band emissions	<u>±4 dB</u>	
Spurious emissions	<u>±4 dB</u>	
Transmitter time domain	<u>1 ns</u>	
<u>characteristics</u>		
<u>Transmitter Intermodulation</u>	<u>±1 dB</u>	
<u>attenuation</u>		
Receiver measurements		
Receiver Selectivity and spurious	<u>±1 dB</u>	
response rejection		
Receiver Sensitivity and flatness	<u>±1 dB</u>	
Receiver blocking	<u>±1 dB</u>	
Intermodulation response rejection	<u>±1 dB</u>	
Receiver co-channel rejection	<u>±1 dB</u>	
Receiver Spurious emissions	<u>±4 dB</u>	

Annex C (informative): Checklist

This annex provides a traceability of the technical parameters for article 3.2 of Directive 2014/53/EU [i.1] defined in ETSI EG 203 336 [i.5] with the technical requirements for conformance defined in clause 4 of the present document.

If a technical parameter for article 3.2 of Directive 2014/53/EU [i.1] defined in ETSI EG 203 336 [i.5] has not been included in the present document, an explanation is provided.

An explanation is also provided whenever a technical parameter defined in ETSI EG 203 336 [i.5] is covered by an alternative technical requirement.

Table C.1: Checklist

Technical Parameters defined in	Clauses of the	<u>Comments</u>
ETSI EG 203 336 [i.5]	present document	
	ransmitter Paramete	<u>rs</u>
Transmit power limits and accuracy	NA	The transmitter power is subject to national
		regulation and therefore no limit can be
		specified.
Transmitter Spectrum mask	4.2.2.2	
Transmitter Frequency stability	<u>4.2.2.1</u>	
Transmitter Intermodulation attenuation	4.2.2.5	
Unwanted emissions (OOB and spurious	4.2.2.2	
domains)	4.2.2.3	
	4.2.2.4	
Transmitter Time domain characteristics (e.g.	4.2.2.6	
the duty cycle, turn-on and turn-off, frequency		
hopping cycle, dynamic changes of		
modulation scheme and others)		
<u>Transmitter Transients</u>	4.2.2.2	This requirement is covered by the spectrum
		mask.
Receiver sensitivity	<u>4.2.3.1</u>	
	<u>4.2.3.6</u>	
Receiver co-channel rejection	<u>4.2.3.4</u>	
Adjacent band/channel selectivity	<u>4.2.3.2</u>	
Spurious response rejection	<u>4.2.3.2</u>	
Receiver blocking	4.2.3.5	
Receiver radio-frequency intermodulation	4.2.3.3	
Receiver unwanted emissions in the spurious	4.2.3.7	
<u>domain</u>		
Receiver dynamic range	4.2.3.8	
Reciprocal mixing	4.2.3.2	Reciprocal mixing is covered by the Selectivity
	4.2.3.5	and the receiver blocking. Moreover TX and RX
		frequencies are fixed and so image frequencies
		are evaluated as part of the intermodulation
		rejection.

Annex D (informative): Bibliography

- ITU Recommendation M.1177-4 (2011): "Techniques for measurement of unwanted emissions of radar equipment".
- ITU Recommendation SM.329-12 (2012): "Unwanted emissions in the spurious domain".

Annex <u>GE</u> (informative): Change history

Version	Information about changes		
1.1.1	First published version.		
	The following technical requirements have been added:		
	Transmitter Intermodulation Attenuation		
	Transmitter time domain characteristics		
2.0.0	Receiver dynamic range		
2.0.0	The RF selectivity and spurious response rejection test is done in an extended		
	frequency range. The environmental profile has been included. The residual power test		
	has been updated. VBW added. General improvement of the text and editorial		
	corrections.
